TABLE OF CONTENTS

Foreword

Introduction

1.0 Medical Roles and Responsibilities
   1.1 Indications for Consultation with Transfusion Medicine Medical Staff Qualifications
       Table 1.1: Indications for Immediate Consultation
       Table 1.2: Transfusion Emergency and TM Medical Director or Delegate is not responding

2.0 Quality System Management
   2.1 Components of Assessment Quality System Essentials

3.0 Informed Consent and Refusal of Consent

4.0 Daily Operations
   4.1 Patient Identification and Sample Labeling Criteria
   4.2 Pre-transfusion Examinations
       Table 4.1: Clinical Significance of Antibodies and Provision of Red Blood Cells
   4.3 Inventory Management

5.0 Appropriate Use of Blood Components for Adults
   5.1 Transfusion of Red Blood Cells to Adults
       Table 5.1: Transfusion Guidelines for Red Blood Cells
       Table 5.2: Transfusion of Red Blood Cells to Adults
       Table 5.3: Selection ABO Compatible Donor Red Blood Cells
   5.2 Transfusion of Platelets to Adults
       Table 5.4: Guidelines for Platelet Transfusion in Adults
       Table 5.5: Relative Contraindications to Adult Platelet Transfusion
   5.3 Transfusion of Frozen Plasma to Adults
   5.4 Transfusion of Cryosupernatant Plasma to Adults
   5.5 Transfusion of Cryoprecipitate to Adults
   5.6 Use of Prothrombin Complex Concentrates (PCCs)

6.0 Special Product Selection
   6.1 Platelet Selection
   6.2 Clinical Practice Recommendations for the Use of Non-ABO Specific Platelets
   6.3 Special Circumstances
   6.4 Platelet Refractoriness and Indications for HLA matched platelets
   6.5 Clinical Practice Recommendations for Management of Platelet Refractoriness
   6.6 CMV Seronegative Red Blood Cells and Platelets
   6.7 Indications for use of CMV seronegative red blood cells and platelets
   6.8 Irradiated Blood Components
       Table 6.1: Recommended Indications for the Use of Irradiated Components
   6.9 Washed Red Blood Cells and Platelets
   6.10 Indications for Washed Red Blood Cells
   6.11 Indications for Washed or Plasma Depleted Platelets
   6.12 Emergency Release of Red Blood Cell Units
7.0 Appropriate Use of Manufactured Blood Products
   7.1 Appropriate Use of Plasma Fractionated Products
   7.2 Indications for the Use of Albumin
   7.3 Indications for the Use of Intravenous Immunoglobulin (IVIG)
   Table 7.1: Use of Recombinant* and Plasma Derived Products that Do Not Require a Special Access Program (SAP) Approval
   Table 7.2: Use of Products that Require Approval through Health Canada Special Access Program or SAP
   7.4 Use of Recombinant Factor VIIa, Erythropoietin

8.0 Appropriate Use of Blood Components in Neonates and Pediatric Patients
   8.1 Neonatal Red Blood Cell and Platelet Transfusion
   8.2 Neonatal Patient Management
   Table 8.1: Threshold and Target Hemoglobin Levels for Neonatal Red Blood Cell Transfusion
   Table 8.2: Indications for Neonatal Platelet Transfusion
   8.3 Pediatric Blood Component Transfusion
   Table 8.3: Pediatric Red Blood Cell Transfusion Guidelines
   8.4 Transfusion of Frozen Plasma to Pediatric Patients
   8.5 Transfusion of Platelets to Pediatric Patients more than 4 months of age
   Table 8.4: Indications for Pediatric Platelet Transfusion (other than neonate)
   8.6 Management of Congenital Anemias
   8.7 Management of Transfusion in Pediatric Patients with Autoimmune Hemolytic Anemia

9.0 Special Transfusion Situations
   9.1 Support of a Patient with a Signed Refusal of Consent for Transfusion
   9.2 Management of a Patient Requiring Massive Transfusion
   9.3 Switching ABO Group in Massive Transfusion or During Inventory Shortage
   Table 9.1: Selection Order of ABO Compatible Donor Red Blood Cells
   Table 9.2: Selection Order of ABO Group for Platelets or Plasma
   9.4 Switching from RhD Negative to RhD Positive Red Blood Cells in Massive Transfusion
   9.5 Massive Transfusion in a Patient with Alloantibodies
   9.6 Transfusion Management of Autoimmune Hemolytic Anemia (AIHA)
   9.7 Transfusion Support for Patients Following Solid Organ or Allogeneic Bone Marrow or Stem Cell Transplant
   9.8 Transfusion Support of Patients with Sickle Cell Syndromes

10.0 Disaster and Contingency Plans

11.0 Transfusion Reactions

   11.3 Transfusion-associated circulatory overload (TACO)
   11.4 Hypotension (bradykinin mediated)
   Table 11.5: Management Algorithm for Hypotension
   11.5 Cytopenias after transfusion
   11.6 Transfusion-associated graft-versus-host disease (GvHD)
   11.7 Rare causes of transfusion-associated cytopenia
   11.8 Hemolysis after transfusion
   11.9 Adverse reactions to intravenous immunoglobulin (IVIG)
   Table 11.6: Adverse Reactions to IVIG
FOREWORD

The purpose of this Resource Manual for Medical Directors of Transfusion Medicine is to provide support and guidance to physicians responsible for transfusion medicine services in the Province of Ontario. It provides a framework outlining sound transfusion laboratory practice, and seeks to advocate for appropriate current practices in the use of both labile blood components and manufactured products. The manual may also serve to assist Medical Directors of Transfusion Medicine Services in their interactions with hospital administration and medical staff in remediation of shortcomings in Transfusion Medicine resources and practices, and also in the area of promotion of education in Transfusion Medicine.

ACKNOWLEDGEMENTS

ORBCoN gratefully acknowledges:

The Ontario Ministry of Health and Long Term Care for their financial support.

The British Columbia Blood Programs Coordinating Office for granting copyright permission to use their document by the same name as a template for the Ontario version.

Dr. Allison Collins and Dr. Peter Pinkerton who reviewed and edited the document and the contributors and material reviewers of the first edition of the Policy Manual for Medical Directors of Transfusion Medicine.

COMMUNICATIONS

The Ontario Regional Blood Coordinating Network welcomes queries regarding this edition of the Resource Manual for Medical Directors of Transfusion Medicine, and invites suggestions for improvements in future editions. Please refer to www.transfusionontario.org for contact information.

LEGAL DISCLAIMER

The publisher, author(s)/general editor(s) and every person involved in the creation of this publication, whether directly or indirectly, shall not be liable for any loss, injury, claim, liability or damage of any kind resulting from the use of or reliance on any information or material contained in this publication. This publication is intended for information purposes only, without any warranties of any kind, and does not amount to advice on which you should rely. Without limitation, the publication should not be relied upon as medical advice or instruction. If specific information on personal health matters is sought, professional advice from a physician or other appropriate health professional should be obtained. The publisher, author(s)/general editor(s) and every person involved in the creation of this publication disclaim all liability in respect of the results of any actions taken in reliance upon information contained in this publication and for any errors or omissions in the publication. They expressly disclaim liability to any user/reader of the publication.
INTRODUCTION

This Resource Manual for Medical Directors of Transfusion Medicine has been produced by the Ontario Regional Blood Coordinating Network, acting under the authority of the Ministry of Health and Long Term Care. It is intended to provide a guide towards the operation, consistent throughout the Province, of the Transfusion Medicine Services by Ontario hospitals, within the context of the capacity of individual institutions of variable size and complexity.

The Manual recognizes the need to comply with the standards defined by the Canadian Standards Association (CAN/CSA Z902) and the Canadian Society for Transfusion Medicine (CSTM) and may be used as a guide to determine where there are deficiencies in practice and the measures necessary to remedy these deficiencies. The policies, procedures and processes presented may not address all clinical eventualities and are not intended to replace a physician’s clinical judgment nor the need for consultation with an expert in transfusion medicine.

It is recognized that the implementation of the policies, processes and procedures proposed herein may represent a challenge for many institutions which provide Transfusion Medicine services. Thus this document should be regarded initially as a guide to organizing Transfusion Medicine policies and a statement of the policies, processes and procedures to be achieved over time – a kind of “road map” to a destination rather than a statement of the current situation in most hospitals.
## 1.0 MEDICAL ROLES AND RESPONSIBILITIES

<table>
<thead>
<tr>
<th>Policy</th>
<th>The Transfusion Medicine Service shall have a Medical Director who is a licensed physician and who will be responsible for the overall conduct of transfusion practice in a hospital or formally recognized group of hospitals.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Qualifications</td>
<td>The Medical Director shall be:</td>
</tr>
<tr>
<td></td>
<td>• A Physician licensed to practice in Ontario, with established evidence of training and expertise in the practice of Transfusion Medicine</td>
</tr>
<tr>
<td></td>
<td>• Be required to undertake and document completion of ongoing continuing education in Transfusion Medicine for maintenance of competence</td>
</tr>
<tr>
<td>General oversight</td>
<td>The Medical Director shall ensure that the Transfusion Medicine service policies and procedures meet all regulatory and accreditation requirements and are consonant with clinical practice obligations of the hospital(s).</td>
</tr>
<tr>
<td>Availability of medical consultation in Transfusion Medicine</td>
<td>The Medical Director or his/her delegate shall be available at all times to provide support and consultation in urgent matters of clinical, technical or administrative importance. Should circumstances dictate that immediate responsibilities are delegated to non-medical personnel, provision shall be made for access to medically qualified transfusion medicine advice.</td>
</tr>
<tr>
<td>Personnel</td>
<td>The Medical Director shall:</td>
</tr>
<tr>
<td></td>
<td>• Supervise the practice of other physicians covering the Transfusion Medicine service in the hospital(s) for which he/she is responsible</td>
</tr>
<tr>
<td></td>
<td>• Ensure that regular performance review of senior technical staff is completed</td>
</tr>
<tr>
<td></td>
<td>• Participate in hiring and performance management of senior technical staff</td>
</tr>
<tr>
<td>Laboratory Supervision</td>
<td>The Medical Director shall:</td>
</tr>
<tr>
<td></td>
<td>• Evaluate and determine the appropriate technical examination methods to be used to support the clinical practices of the hospital(s), including reagents, supplies and equipment</td>
</tr>
<tr>
<td></td>
<td>• Continuously assess and evaluate evolving technologies with potential to provide scientifically improved and/or more cost-effective service</td>
</tr>
<tr>
<td></td>
<td>• Ensure that policies, processes and procedures are clearly defined in writing, consistently applied and updated in a timely manner when changes are made</td>
</tr>
<tr>
<td></td>
<td>• Ensure technical and medical staff compliance with defined policies, processes and procedures</td>
</tr>
<tr>
<td></td>
<td>• Ensure that any external services provide reference laboratory testing on behalf of the blood transfusion service are utilizing validated techniques</td>
</tr>
<tr>
<td></td>
<td>• Ensure staffing levels to meet the workload requirements to provide for optimal support of patient care</td>
</tr>
<tr>
<td></td>
<td>• Ensure that laboratory reports are accurate, timely and delivered in clinically helpful terms</td>
</tr>
<tr>
<td></td>
<td>• Be actively involved in, and sign off on, the regular review of Transfusion Medicine Laboratory Procedure Manual (SOPs)</td>
</tr>
<tr>
<td></td>
<td>• Ensure that policies and processes for blood sample procurement, patient identification, sample identification and handling and sample processing meet required standards of accuracy and safety</td>
</tr>
<tr>
<td></td>
<td>• Institute remedial action when examination processes deviate from internal or external quality assurance requirements</td>
</tr>
</tbody>
</table>
### 1.0 MEDICAL ROLES AND RESPONSIBILITIES

**Role in clinical transfusion practices and product utilization:**

The Medical Director shall:
- Approve blood component and product inventory requirements to meet clinical program needs while minimizing component and product wastage
- In collaboration with Transfusion Committee members, develop clinical practice guidelines to be referred for approval to the Medical Advisory Committee
- Approve policies, processes and procedures for blood component and product ordering and distribution
- Ensure that blood products received from other institutions (e.g. as part of a hospital redistribution program) have been stored and shipped according to necessary regulations and requirements
- Ensure that protocols and guidelines for prescribing and administering transfusion of blood components and products are up to date and available where these are administered
- Ensure that these protocols and guidelines are used to develop training programs for staff administering blood components and products
- Provide input into the creation of procedures to ensure the appropriate use of blood components and manufactured products (e.g. IVIG) through prospective and retrospective reviews, consultation and audits
- Participate in the activities of hospital transfusion committee(s), including contributing to the composition of appropriate terms of reference
- Assist in the establishment of a Hospital Emergency Blood Management Committee (HEMBC) and collaborate with administration on the development of the hospital's contingency plan for the management of blood shortages
- Work with clinical, administrative, nursing and other ancillary staff to ensure that transfusion related equipment (e.g. blood salvage and warming devices) and their use meet current regulatory requirements under the Institute for Quality Management in Healthcare (IQMH) and are in compliance with the current versions of the CSA and CSTM. Maintain awareness of regulatory requirements of Health Canada as they relate to the hospital transfusion service
- Ensure that all blood product manufacturing processes undertaken by the hospital (including pre-operative autologous donation, intra-operative cell salvage, directed and walking donor programs) are performed according to applicable regulations and requirements
- Ensure that all blood products issued for use outside the hospital (e.g. shipment to dispensary facilities, home transfusion programs, or directly to patients for home use) are handled and administered according to applicable regulations and requirements

**Consultation and education**

The Medical Director shall:
- Provide consultation and professional advice to physicians prescribing or administering blood components and products, including, where appropriate, advice on clinical blood component or product usage
- Provide continuing education in transfusion medicine standards and practices to physicians, nurses and technologists
- Where applicable provide access to education in Transfusion Medicine to medical students and residents
- Cooperate with medical, technical and nursing personnel to establish and maintain programs to ensure ongoing quality and competence in transfusion practice
- Ensure that medical and non-medical staff members using transfusion related equipment (e.g. blood salvage devices, blood warmers, apheresis devices) are trained and competent to do so, that such training and competence is documented, and that ongoing preventative maintenance protocols for such equipment are in place
1.0 MEDICAL ROLES AND RESPONSIBILITIES

Quality Management

The Medical Director shall:

- Supervise and participate in the management of quality systems to ensure that examinations performed in the Transfusion Medicine Service provide accurate, reliable and timely results required to support high quality patient care.
- Ensure implementation of established current Transfusion Medicine Standards as required under IQMH and defined by the CSA and CSTM.
- Ensure compliance with all National and Provincial regulatory requirements, including participation in mandated external quality assurance schemes.
- Review external quality assurance examination results, and initiate and oversee remedial action when these results are unsatisfactory.
- Ensure mechanisms are in place for the recording of adverse events, of the results of review of quality assurance data (external and internal) and of any consequent remedial actions.

External Reporting Relationships

The Medical Director shall ensure:

- Compliance with reporting requirements of Health Canada (HC), Public Health Agency of Canada (PHAC), Canadian Blood Services (CBS) and IQMH.
- Timely participation in lookback and traceback investigations as required by CBS.

1.1 Indications for Consultation with Transfusion Medicine medical staff

Policy

The Medical Director, Transfusion Medicine or delegate shall be available at all times for consultation on clinical, technical, administrative or quality issues.

Rationale

The reason for this policy is the requirement for medical input from a physician knowledgeable in transfusion medicine to:

- Assess patient needs.
- Advise in the selection of appropriate blood products in unusual or specialized circumstances.
- Consult on the management of adverse transfusion reactions.
- Assist with patient blood management and appropriate blood conservation measures.

Responsibility of the Medical Director, Transfusion Medicine

The Medical Director shall be responsible for providing a contact list to Transfusion Medicine Staff and for ensuring the availability of Medical Staff support at all times. The Medical Director shall define the indications for contacting the Medical Director or scheduled delegate, and the procedure to be followed if the Medical Director or delegate is non-responsive (including appropriate documentation).

Table 1.1 Indications for Immediate Consultation

<table>
<thead>
<tr>
<th>Situation</th>
<th>When</th>
</tr>
</thead>
</table>
| Blood product shortage | • Reasonable possibility that medical or surgical blood products requests will not be met  
                         | • Amber or red phase blood product shortage declared by Canadian Blood Services  
                         | • The contingency plan for blood shortages requires it to be implemented  
                         | • Screening of requests during critical shortages according to policies set by the Hospital Emergency Blood Management Committee, in accordance with the National Plan for the Management of Shortages of Labile Blood Components and the Ontario Contingency Plan for the Management of Blood Shortages |
| Errors             | • Any error with the potential to result in adverse consequences to a recipient such as an incorrect or incompatible blood product has been issued  
                         | • Clerical or other error has led to release of an incorrect or incompatible unit (even if not actually transfused)  
                         | • Sampling error detected that may affect one or more patients |
| Transfusion reactions | • Symptoms suggestive of severe transfusion reaction notified by verbal contact from patient location (MD, RN) or by transfusion reaction report form  
• Post-transfusion work-up reveals features suggestive of incompatibility such as icteric or hemolysed sample or positive DAT post-transfusion, and further transfusion is medically indicated  
• Requests received for further blood product transfusion before transfusion reaction investigation is completed  
• At technologist’s discretion |
| --- | --- |
| Massive transfusion | • Patient’s blood volume is replaced over a short period (>10 units within 24 hours) and there is continuing blood loss  
• Initiation of Massive Hemorrhage Protocol (MHP) if applicable  
• Clinically significant antibodies are detected in a sample from a massive transfusion recipient  
• RhD-negative patient of child-bearing potential is switched from RhD-negative to RhD-positive red blood cells or platelets according to established policy |
| STAT/urgent/special red blood cell unit requests | • Blood issued “uncrossmatched” is found to be incompatible  
• Permission is required to issue crossmatched incompatible units, with the exception of patients with autoantibodies where complete investigation has excluded all clinically significant antibodies  
• Compatible or antigen negative units are not available (e.g. antibody to high incidence antigen; multiple antibodies present; warm reactive auto-antibody)  
• Request is received for blood for transfusion before an antibody investigation is completed  
• Release of a large number of O RhD-negative units threatens appropriate inventory levels or cannot be supported by CBS  
• Clinically significant antibody is found in a neonatal sample and the infant has biochemical evidence of hemolysis  
• Request for use or dose of blood component or product inappropriate to the institution’s Transfusion Medicine guidelines, or where there will be delay in availability for transfusion  
• Need to transfuse untested or partially tested components or products from CBS |
| RhD-positive products to RhD-negative patient | • Any RhD-positive product is to be issued for an RhD-negative recipient of child-bearing potential, unless a pre-approved policy or specific instruction is in place  
• RhD-positive platelets are to be given to an RhD-negative recipient of child-bearing potential and RhIg is required, unless a pre-approved policy or specific instruction is in place |
<table>
<thead>
<tr>
<th>Other blood product requests requiring consultation with the Medical Director, Transfusion Medicine</th>
</tr>
</thead>
</table>
| • Urgent request for use or dose of any blood component or product outside the institution’s Transfusion Medicine guidelines  
• A new request is received for irradiated and/or CMV sero-negative product does not meet established indications  
• A new request is received for:  
  » Washed or plasma-depleted cellular component  
  » HLA matched platelets  
  » IVIG not meeting MOHLTC guidelines unless a pre-approved policy assigns this responsibility to other physicians at the facility  
  » Coagulation factor products for new single factor patient  
  » Rarely requested products (e.g. recombinant factor VIIa, C1 esterase inhibitor)  
  » Exchange or intra-uterine transfusions  
• Platelets are requested for a patient with a diagnosis of ITP, TTP/HUS, heparin induced thrombocytopenia or undiagnosed thrombocytopenia  
• Urgent request for platelets for transfusion and no platelets are immediately available  
• Infusion of any component or product beyond its expiration time  
• Allogeneic unit is sought when autologous unit(s) is (are) available  
• Urgent request (e.g. from OR) for red blood cells for a patient with alloantibodies  
• Request for red blood cells in presence of high thermal amplitude cold agglutinin  
• Request for red blood cells for a patient with a sickle cell syndrome (see section 9.8)  
• Request for prothrombin complex concentrates for other indications than emergency warfarin reversal  
• Requests for therapeutic apheresis  
<table>
<thead>
<tr>
<th>Issues of product quality</th>
</tr>
</thead>
</table>
| • There is any doubt about component or product quality and clinical circumstances require urgent transfusion  
• Identification of a component or product of questionable quality leading to quarantine should be reported on the next working day  
<table>
<thead>
<tr>
<th>“Code Orange” (Disaster Plan Notification)</th>
</tr>
</thead>
</table>
| • On receipt of a “code orange” notification, whether external (e.g. major transportation crash) or internal (e.g. extended computer downtime or power failure)  
<table>
<thead>
<tr>
<th>Miscellaneous issues</th>
</tr>
</thead>
</table>
| • Patient with refusal to consent to transfusion:  
  » Blood components or products are subsequently requested for or transfused to a patient who refused transfusion based on religious or other beliefs  
• Unusual situations not covered above:  
  » Immediate notification at the discretion of medical laboratory technologist  

<table>
<thead>
<tr>
<th>Table 1.2: Transfusion Emergency and TM Medical Director or delegate is not responding</th>
</tr>
</thead>
<tbody>
<tr>
<td>If</td>
</tr>
</tbody>
</table>
| Transfusion is urgently required | • Contact patient’s physician immediately to confirm patient’s clinical needs outweigh potential hazards of transfusion  
• Prepare and release requested products  
• Continue to try to contact Transfusion Medicine Director or delegate  
• Document the episode |
The patient is at risk of hemolytic transfusion reaction or other identifiable severe hazard of transfusion:

- Information emerges (e.g. technical error) putting a patient at risk of hemolytic transfusion reaction or other identifiable severe hazard of transfusion:
  - Contact patient location immediately to request transfusion be stopped
  - Notify the patient’s physician as soon as possible
  - Continue to try to contact Transfusion Medicine Director or delegate

REFERENCES
## 2.0 QUALITY SYSTEM MANAGEMENT

### Policy
- The Transfusion Medicine Service has established policies, processes and procedures to ensure full compliance with accepted regulatory and accreditation requirements, and good laboratory practices
- The Medical Director has overall responsibility for the quality of work performed in the Transfusion Medicine laboratory and for all transfusion activities

### Responsibilities of the Medical Director, Transfusion Medicine
- Maintain awareness of the current applicable standards and requirements: CAN/CSA, CSTM and IQMH and oversee compliance with these standards
- Ensure implementation of the quality management system
- Monitor the effectiveness of the quality management system through, but not necessarily confined to:
  - Participation in or if necessary chairing the Transfusion Committee
  - Providing consultation on proposed audits and other internal quality assessments to the Transfusion Committee and overseeing such audits
  - Establishing internal indicators to assess the quality of practice within the Transfusion Medicine Service
  - Ensuring errors, incidents and accidents involving the hospital's blood transfusion service are reported to the appropriate error management programs
- Participate in reviewing the performance of the Transfusion Medicine Service, collaborate in the development of corrective action when deficiencies are recognized, and promote quality improvement measures

### Responsibilities of Transfusion Medicine Service Staff
- Perform technical procedures and quality examinations according to established policies, processes and procedures
- Inform and consult with the Medical Director, Transfusion Medicine (or delegate) on any instances of non-compliance, adverse event or failed performance on quality control samples and any other issues of quality system concern
- Be familiar with and follow the policies defined in section 1.1 regarding notification of the Medical Director (or delegate) of matters of potential clinical concern

### Transfusion Medicine Quality Assessments
- The following have been established to carry out quality oversight:
  - Transfusion Committee (or other Committee charged with oversight of the Transfusion Service), reporting to the Medical Advisory Committee
  - Audit and utilization management processes
  - System to investigate and document adverse events and errors including the Transfusion Transmitted Injury Surveillance System (TTISS)
### 2.1 COMPONENTS OF ASSESSMENT QUALITY SYSTEM ESSENTIALS

| Transfusion Committee | Members include key stakeholders and representatives from the major users in the institution including the Director of Transfusion Medicine. The committee must function under the authority of the Medical Advisory Committee. Guidance in the establishment and conduct of hospital Transfusion Committees can be found in the “Transfusion Committee Handbook” at [www.transfusionontario.org](http://www.transfusionontario.org). The committee meets regularly to:  
• Assist in defining blood transfusion policies appropriate to the hospital’s clinical programs  
• Contribute to the development of criteria for the evaluation of ordering practices, usage (including wastage of blood components and products), administration policies and the ability of the Transfusion Medicine Service to meet the clinical needs of the hospital  
• Ensure that regular evaluations of transfusion practices are undertaken and to review the results of such evaluations  
• Evaluate reports of adverse transfusion events and all transfusion errors, as well as relevant external (Provincial, Federal or international) reports on adverse transfusion events  
• Recommend corrective measures as required  
• Ensure that patients are made aware of any alternatives to allogeneic blood transfusion that are available to them, and that such alternatives are in place wherever feasible with appropriate recommendations on their use  
• Facilitate the dissemination of information and promote education relevant to transfusion medicine  
• Review any changes in blood components or products available through CBS (new products or changes to existing products or components) |
|---|---|
| Audit and Utilization Management | • The audit process is used to monitor and improve blood transfusion practices. Audit or utilization review may be retrospective or prospective  
• Criteria that trigger audits are based on current practice guidelines. The process is used to provide educational feedback to physicians using blood components or products in a manner inconsistent with guidelines  
• Audit can be used to monitor and improve component and product wastage and inventory management  
• Audits are initiated through the local or regional Transfusion Committee and results are analyzed and reported by this group  
• Audit and utilization management reports are sent to appropriate administrative personnel within the hospital corporation and/or regional laboratory program where appropriate  
• Where the clinical use of blood component or product may be outside of the hospital’s guidelines or deviate from evidence based ‘best practices’, audit and utilization management data are shared with the appropriate clinical department head  
• Prospective utilization reviews may be indicated if there is the potential for inappropriate transfusion decisions due to inexperience, particularly with expensive or rarely prescribed items  
• Transfusion practices and patient care may be improved and costs diminished by assessing transfusion requests against guidelines before products/components are given, and advising clinicians of non-conformance to guidelines |
2.0 QUALITY SYSTEM MANAGEMENT

### Adverse Events and Error Management

- The Transfusion Medicine Service has policies, procedures and processes to define, detect and document adverse transfusion events and errors, both within the Service and externally throughout the hospital. The process includes the documentation of “near misses” where an error or adverse event did not actually occur because it was detected in time to be corrected.
- Adverse event and error reporting data are reviewed regularly including root cause analysis.
- A summary of non-serious events and near misses and a comprehensive report of events resulting in potential or actual serious harm are reviewed by the Transfusion Committee and communicated to hospital management.
- The results of adverse event and error reporting are to be used to create quality improvements within the Transfusion Medicine Service or elsewhere in the hospital.
- If available and appropriate, the Transfusion Medicine Service shall participate in any national or provincial error or injury surveillance programs (e.g. TTISS).

### Policies regarding management of transfusion in HPC and solid organ transplant recipients

- In collaboration with the regional referral centre for solid organ and tissue transplant, each facility should establish policies and procedures for the management of pre and post transplant patients.

**Note:** The management of transplant patients varies throughout the province. Consultation with referral centres is advised.

## 3.0 INFORMED CONSENT AND REFUSAL OF CONSENT

| Policy | • Procedures for the administration of blood components and products shall include a mechanism for obtaining informed consent  
• Elements of informed consent include discussion of:  
  » A description of the blood component(s) and/or product(s) which may be transfused  
  » The risks of such transfusion  
  » The expected benefits of such transfusion  
  » Possible alternatives to transfusion and the risks and benefits of such alternatives  
  » The patient must be given the opportunity to ask questions and have concerns addressed  
  » The clinical indication for transfusion shall be recorded in the patient’s medical record  
• In the case of planned elective transfusion, this discussion should take place well in advance of the planned procedure or course of treatment to allow for the application of possible alternatives  
• Evidence of acceptance or refusal of informed consent for the transfusion of blood components or products shall be recorded in the patient’s medical record, whether written or electronic |
| --- | --- |
| Reason | • Informed consent is a process undertaken jointly by a patient (or substitute decision maker where required) and a physician to make a therapeutic decision in a manner that preserves the patient’s primary decision-making role in determining a course of treatment  
• Obtaining consent for medical treatment in general is a principle of common law (Ontario Consent to Treatment Act, 1996)  
• Consent specifically for transfusion of blood components and products, while not expressly required by law in Ontario, is a requirement of the standards published by the CSA, CSTM and IQMH |
| Patient population | • All patients for whom transfusion is indicated or may be indicated  
• In circumstances where consent cannot be obtained (e.g. under anaesthesia or trauma) |
| Responsibilities of Medical Director, Transfusion Medicine | Provide information, promote education for and consult with all health professionals involved in the transfusion process about:  
• The risks and benefits of transfusion of blood components and products  
• The appropriate use of blood components and products  
• Alternatives to transfusion |
| Responsibilities of Treating physician | • Obtain consent for or refusal of transfusion and document in the patient’s medical record  
• Complete the facility specific form for consent or refusal if applicable |
| Responsibilities of Treating nurse | • Confirm that consent has been recorded in the patient’s medical record before requesting product from the Transfusion Medicine Service  
• Inform or send a record of refusal (if applicable) of transfusion to the Transfusion Medicine Service for entry in its record system |
| Responsibilities of Transfusion Medicine Staff | • Record refusal of consent to transfusion in Transfusion Medicine Service patient information file on receipt of notification of refusal  
• Check patient history in Transfusion Medicine Service information file on receipt of request for component or product  
• Notify Medical Director, Transfusion Medicine when blood component or product is requested for a patient for whom a record of refusal of consent is on record |
### Refusal of consent

- The discussion and refusal of consent shall be recorded in the patient’s medical record.
- The Transfusion Medicine Service should have a notation of the refusal of consent in its patient information file, as a secondary check to prevent release of blood component or product that is ordered erroneously.

### 4.1 PATIENT IDENTIFICATION AND SAMPLE LABELING CRITERIA

<table>
<thead>
<tr>
<th>Policy</th>
<th>• The Transfusion Medicine Service Shall develop and implement policies, processes and procedures for patient identification, and sample collection and identification, using first and family name plus at least one other unique identifier (e.g. hospital medical record number)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• An alternative process must be developed to provide for interim identification of patients when name and other unique identifiers are unavailable</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Reason</th>
<th>• Most serious and potentially fatal transfusion reactions are due to the administration of the wrong unit of blood to the wrong patient, so the transfusion service must take steps to ensure correct identification of patient samples, sub-samples and intended recipients</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• The Transfusion Medicine Service has a major role in educating nurses and other health care professionals collecting or administering blood, in correct recipient identification and should be involved in the development of appropriate patient identification systems</td>
</tr>
</tbody>
</table>
### Patient identification at sample collection

Sample collection policies, processes and procedures for patients must include but are not limited to the following:

- Samples should not be collected from patients lacking patient identification at least meeting the criteria above (see section 4.1 under policy)
- Phlebotomists should only collect blood from in-patients displaying defined identification, e.g. hospital armband or other institutionally approved device
- A specific policy should be developed to ensure accurate identification of out-patients and patients in the pre-admission process who are not displaying such defined identification
- Instructions must include:
  - Measures required when the patient is not able to use an armband or other means of identification as normally defined
  - Measures to identify patients requiring urgent transfusion in the absence of identifying information, and to reconcile temporary identification with name and unique identifier information

### Patient identification at transfusion

- Procedures defining the measures to be taken to identify patients to whom transfusion is to be administered shall be developed, which match the patient’s unique or interim identifiers to the information provided on the label on the blood component or product
- Transfusions shall not be administered to patients who lack some positive (including interim) identification
- Procedures defining the measures required to cover emergency transfusions for unidentified patients and patients “not yet identified” shall be developed

### Patient identification and sample labeling criteria

- Sample labeling policies and procedures must include, but are not limited to the following:
  - The phlebotomist must label the blood sample tubes with the first and family name of the patient, plus the unique identifier(s), and the collection date **BEFORE** leaving the patient
  - The phlebotomist must be identifiable on the sample label or the associated requisition and this information must be retrievable for one year (CSA Z902-15 20.6.3.5)
  - Policies, procedures and processes must include the steps to be followed by laboratory staff when the information on the blood sample tube(s) does not match that on the request form (i.e. sample rejection criteria)

### REFERENCES

## 4.2 PRE-TRANSFUSION EXAMINATIONS

The following examinations must be performed before transfusion:

<table>
<thead>
<tr>
<th>Serologic Examinations</th>
<th>ABO and RhD Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ABO and RhD type</strong></td>
<td></td>
</tr>
<tr>
<td>- To provide ABO-group-compatible red blood cells, there shall be at least two determinations of the recipient’s blood group on record: one from a current sample and the second from the recipient’s previous records; testing of a separate sample collection; or retesting of the same sample where positive patient identification technology was used at the time of sample collection.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> Positive patient identification technology refers to a computerized system that uses a barcode, radio-frequency identification (RFID), or another electronically readable element on a patient’s identification band to confirm identity.</td>
<td></td>
</tr>
<tr>
<td><strong>Indirect antiglobulin test (IAT) for weak expression of the RhD antigen</strong></td>
<td></td>
</tr>
<tr>
<td>- Recommended in the following circumstances:</td>
<td></td>
</tr>
<tr>
<td>» All patients where anti-D reagent(s) give &lt;2+ reactions on immediate spin phase of tube testing and weak anti-D testing has not previously been performed. (Note: if D typing is automated, standardized cut off grading and interpretation for weak D testing should be established according to validation of Rh typing prior to implementation of automated platform)</td>
<td></td>
</tr>
<tr>
<td>» Where RhD typing discrepancies are found between current and previous results, where previous results were RhD negative and one or both current anti-D test results are &lt;2+ on immediate spin phase of testing</td>
<td></td>
</tr>
<tr>
<td>» For RhD negative newborn infants to determine the need for RhIG for an RhD negative mother</td>
<td></td>
</tr>
<tr>
<td>» For RhD negative fathers upon request to determine the need for RhIG in a RhD negative mother</td>
<td></td>
</tr>
<tr>
<td>- Tests for weak RhD antigen are NOT recommended in the following circumstances:</td>
<td></td>
</tr>
<tr>
<td>» Patients whose sample reactions are negative with both anti-D reagents</td>
<td></td>
</tr>
<tr>
<td>» Weak anti-D testing has already been performed</td>
<td></td>
</tr>
<tr>
<td>» If the DAT is positive on the test sample</td>
<td></td>
</tr>
<tr>
<td>» If the patient has received transfusion within the previous 3 months with red blood cells of a different Rh type</td>
<td></td>
</tr>
<tr>
<td>» Routine examination for other Rh antigens is not recommended</td>
<td></td>
</tr>
<tr>
<td>» Policies should be established for Rh phenotyping and the provision of Rh phenotypically matched red blood cells when the diagnosis indicates chronic transfusion is likely e.g. myelodysplastic syndrome, sickle cell disease</td>
<td></td>
</tr>
<tr>
<td>» If an RhD typing problem is detected and urgent transfusion is required, RhD negative components should be used if available, pending resolution</td>
<td></td>
</tr>
</tbody>
</table>
| **Note:** A policy for the administration of Rh Immune Globulin should be established for obstetrical patients who type as weak D. Rh genotyping is available through the National Reference Laboratory at CBS and could be considered for confirmation of weak D typing to determine the need for Rh prophylaxis in pregnant women.
In addition to the determination of the ABO and RhD type:
- The patient’s historical record should be reviewed
- Antibody screen of patient’s serum/plasma for unexpected red blood cell antibodies should be completed before red blood cells are transfused in non-emergency settings
  - Examination method for antibody screening must be sensitive enough to detect clinically significant antibody above a commonly accepted threshold level.
  - Acceptable methods include solid phase, gel or indirect antiglobulin test
  - Negative controls or check cells must be included to validate negative saline indirect antiglobulin tube test results
- There should be a guideline for the standardized interpretation and grading of hemagglutination reactions (see references)

| Routine crossmatch examinations | Blood samples for crossmatch examination should be collected and examined no more than 96 hours before the intended transfusion
  - This interval may be extended in patients with a history of no transfusion or pregnancy within 3 months
  - Procedures should be in place to ensure that “group and screen” results are completed and available before elective surgery commences where the chance of blood transfusion support being required is >5%
- The hospital shall have a policy defining how long in advance of an intended surgical procedure pre-admission samples may be collected, and examined provided ALL of the following conditions are met:
  - Antibody screen is negative and
  - Patient has not been transfused within the last 3 months, and
  - Patient has not been pregnant within the last 3 months
- The Transfusion Medicine Service must have in place a process to determine whether the patient is pregnant or has been transfused since the date of collection of the pre-admission sample
  - If the patient has been transfused or pregnant in the interval, or the history is unknown, a group and screen must be performed on a sample collected within 96 hours of the intended transfusion

| Electronic Crossmatch | Requires second determination of the patient’s ABO blood group, see Serologic examinations for details.
- Electronic crossmatch is adequate to issue red blood cell containing component when there is:
  - No clinically significant antibody detected in current antibody screening and
  - No previous record of a clinically significant antibody
  - Confirmation of the ABO group of all red blood cell containing units involved
  - An appropriately validated computer system licensed for the provision of electronic crossmatching

| Immediate spin crossmatch | Immediate spin crossmatch is adequate to issue red blood cell containing component when there is:
  - No clinically significant antibody detected on antibody screening, and
  - No previous record of a clinically significant antibody
  - Relevant isohemaglutinins (anti-A, anti-B) demonstrate a 1+ or greater reaction
- Requires second ABO determination, see Serologic examination for details.

| Crossmatch examinations in emergency situations | Emergency release policies, process and procedures apply when there is insufficient time before transfusion of a red blood cell containing component to:
  - Complete an antibody investigation
  - Source appropriate blood products
  - Perform a crossmatch
| Crossmatch examinations with positive antibody screen | • If the antibody screen is positive, the antibody(ies) must be identified, with repeat investigations on subsequent samples from the same patient performed according to institutional policy  
• If the antibody(ies) is/are clinically significant:  
  » Antigen negative units must be selected, if available  
  » A full serological crossmatch must be completed and blood reserved for the patient |

| Antibody investigation and reporting | • All patient samples with positive antibody screen shall be investigated prior to transfusion unless clinical urgency requires immediate release of blood.  
  » Issue indirect IgG antiglobulin test compatible units if possible  
  » The Medical Director, Transfusion Medicine (or delegate) and ordering physician should be contacted prior to issue  
  » Routine release of group O RhD negative units by emergency release is not an acceptable alternative  
• The interval between antibody detection examinations for patients with previously identified red blood cell antibodies who have been transfused or pregnant within the last 3 months should be 96 hours, to identify any new allo-antibodies. A policy establishing the interval between antibody investigation when antibody detection testing demonstrates no new detectable antibodies should be established  
• If antibody investigation services are not provided by the hospital Transfusion Medicine Service, samples may be referred to another Transfusion Medicine Service in an associated hospital or to an external reference laboratory such as CBS Laboratory Services  
• Results of the antibody investigation(s) must be forwarded to the patient’s physician and the hospital Medical Records Service, and be recorded in the Transfusion Medicine Service files |

4.3 INVENTORY MANAGEMENT

Policy

The Transfusion Medicine Service has established an inventory management program appropriate to support the clinical programs delivered in the hospital. Inventory management is crucial to avoid unnecessary wastage due to overstocking and to support effective utilization of blood, blood components and products.

Reason

The objective is to provide adequate supplies of blood, blood components and products for routine and emergency situations while minimizing loss by outdating.

Responsibilities of the Medical Director, Transfusion Medicine

- To determine minimum and optimum hospital inventory levels and to review the inventory levels periodically, or in light of clinical program changes which may influence requirements
- To implement measures that assist in improving inventory management
- To provide the communication link between treating physicians and the Transfusion Medicine Service in critical shortage situations and to discuss alternatives or cancellation of elective procedures
- Ensure that a hospital plan in place for the management of blood shortages is established in accordance with the Ontario Contingency Plan for the Management of Blood Shortages
- Implement when necessary the measures laid out in the Ontario Contingency Plan for the Management of blood shortages

Responsibilities of Transfusion Medicine Service staff

- Maintain the inventory according to the guidelines and implement policies and procedures as required
- Ensure that defined proper procedures are used in packing, shipping or receiving blood, blood components and products
- Report inventory to CBS regularly
### Components of an inventory/conservation management system

An inventory management/conservation system should have:

- Ability to select the oldest blood for transfusion, provided it is of an appropriate ABO and Rh group, and meets any necessary special requirements (e.g. irradiated)
- Flexibility to use fresher blood when indicated (e.g. dedicated aliquots for neonates)
- Where feasible, a blood redistribution program, especially for any components or products near expiry, as sender or receiver, at the discretion of the Medical Director, Transfusion Medicine
- A policy regarding the issue of non-group specific platelets that are about to outdate
- A mechanism to minimize inventory sequestered for specific patients (use of abbreviated crossmatch procedures; immediate spin, electronic)
- A maximum surgical blood order (MSBOS) schedule based on local practices and patient population to provide screening guidelines to monitor requests, updated at scheduled intervals
- A mechanism to review wastage data by patient location to identify process improvement strategies to minimize component and product loss
- Monitoring crossmatch/transfusion ratios
- Transfusion Committee review and audit of effectiveness and safety of inventory management and conservation measures

### Critical shortages

The Transfusion Medicine Service shall have established policies, processes and procedures to respond to shortages:

- An approved, institution-specific contingency plan for the management of blood shortages that ensures conformity with the National and Provincial Contingency Plans for Blood Shortages
- Procedures should detail circumstances under which the Medical Director, Transfusion Medicine will:
  - Convene the Hospital Emergency Blood Management Committee (HEMBC)
  - Activate the communication plan to clinical staff and patients regarding the cancellation of elective surgical procedures and transfusions
  - In conjunction with treating physicians, implement blood conservation strategies
- Define steps to be taken when to:
  - Switch from ABO identical to ABO compatible units
  - Switch from RhD negative to RhD positive units
  - Initiate inter-hospital redistribution
  - Decrease platelet dose from 1 single donor (apheresis) unit or 1 pool of 4 buffy-coat derived platelets to “half-unit” platelet transfusions
  - Triage all blood component/product requests to ensure compliance with the Provincial Blood Shortage Contingency Plan

5.0 APPROPRIATE USE OF BLOOD COMPONENTS FOR ADULTS

<table>
<thead>
<tr>
<th>Policy</th>
<th>The Transfusion Medicine Service follows established guidelines for the appropriate use and administration of blood components and products to patients.</th>
</tr>
</thead>
</table>
| Reason | • Facilitate the efficacious and appropriate use of blood components and products  
• Facilitate compliance with hospital guidelines for product dosage  
• Enhance patient safety by the judicious use of blood components and products and reduction of inappropriate transfusion practices |
| Responsibilities of the Medical Director, Transfusion Medicine | • Be familiar with available guidelines for the use of and indications for use of blood components and products  
• Be familiar with the appropriate use of and indications for use of blood component and products  
• Be available to consult with treating physicians and other staff in the appropriate use and administration of blood components and products  
• Initiate discussions with clinical staff when laboratory results and/or clinical circumstances suggest use of a blood component or product may, or may not, be indicated  
• Use such consultations and discussions to promote education in appropriate transfusion practices  
• Ensure availability of adequate educational material for physicians or other health professionals who prescribe blood components and products  
• Establish a mechanism to prospectively review orders for blood and blood components/products for appropriateness of indication and dosing  
Note: If prospective screening is not performed, a mechanism for periodic retrospective audit should be established. |
| Responsibilities of Transfusion Medicine Service staff | • Follow established process for prospective screening of orders for blood and blood components/products  
• Consult with the Medical Director, Transfusion Medicine or delegate when concern is raised that a blood component/product order (including indication, dose or timing) may not be compliant with the institution’s guidelines (and cannot be directly resolved with clinical staff) |

REFERENCES
5.1 TRANSFUSION OF RED BLOOD CELLS TO ADULTS

- Guidelines for transfusion of red blood cells have been published by several organizations [see www.transfusionontario.org/en].
- The decision to transfuse an individual patient is based on:
  » Signs and symptoms of inadequate tissue oxygen delivery
  » Ongoing blood loss
  » Hemoglobin concentration
  » Other patient factors e.g. coronary insufficiency, traumatic brain injury and patient preferences
- For an example of hospital specific guideline threshold and target hemoglobin levels for red blood cell transfusion – see table 5.1
- More detail is supplied in Table 5.2

Table 5.1 – An Example of Transfusion Guidelines for Red Blood Cells

<table>
<thead>
<tr>
<th>HEMOGLOBIN g/L</th>
<th>Units</th>
<th>RECOMMENDATION</th>
</tr>
</thead>
</table>
| less than 60   | 1 - 2 | Transfusion highly recommended  
  • Young patients may tolerate greater degrees of anemia  
  • Patients with chronic iron deficiency can usually be treated with IV iron alone |
| less than 70   | 1     | Likely appropriate |
| less than 80   | 1     | Likely appropriate in patients with cardiovascular disease |
| less than 90   | 1     | Only if there are signs and symptoms of impaired tissue oxygen delivery |
| greater than 90| none  | Likely inappropriate  
  Consult Blood Bank physician and document indication in patient chart |
### 5.0 Appropriate Use of Blood Components for Adults

#### Table 5.2 Transfusion of Red Blood Cells to Adults

<table>
<thead>
<tr>
<th>For adult patients</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Receiving transfusion for acute blood loss</strong></td>
<td>- Maintain hemoglobin &gt; 70g/L during active bleeding:</td>
</tr>
<tr>
<td></td>
<td>» Consider rate of blood loss, hemodynamic factors, evidence of tissue ischemia, institutional speed of blood delivery and laboratory testing in decision about transfusion</td>
</tr>
<tr>
<td></td>
<td>» Ensure prompt blood availability when hemoglobin is &lt;80g/L</td>
</tr>
<tr>
<td></td>
<td>- Consider maintaining hemoglobin at a higher level (&gt;80 g/L) in patients with:</td>
</tr>
<tr>
<td></td>
<td>» Unstable or acute coronary syndromes</td>
</tr>
<tr>
<td></td>
<td>» Coronary artery disease</td>
</tr>
<tr>
<td></td>
<td>» Uncontrolled/unpredictable bleeding</td>
</tr>
<tr>
<td><strong>With anemia in coronary or critical care</strong></td>
<td>- Recommend transfusion when patient’s hemoglobin is &lt;70g/L</td>
</tr>
<tr>
<td></td>
<td>- In a patient with an acute coronary syndrome there is controversy over the desirable hemoglobin level:</td>
</tr>
<tr>
<td></td>
<td>» Data are insufficient to recommend maintaining hemoglobin above an arbitrary level but a target of 80-90g/L is considered acceptable</td>
</tr>
<tr>
<td></td>
<td>» Consider transfusing if there are clear signs of inadequate tissue oxygen delivery</td>
</tr>
<tr>
<td></td>
<td>- Except for patients with unstable coronary syndromes, restrictive transfusion policy (trigger 70g/L) has proved at least as effective as a liberal transfusion policy for the critically ill</td>
</tr>
<tr>
<td></td>
<td>- Unnecessary phlebotomy contributes significantly to anemia in the critically ill and strategies should be implemented to minimize blood draws</td>
</tr>
<tr>
<td><strong>Peri-operative patients</strong></td>
<td>- Manage patients undergoing elective surgery with approaches to minimize need for transfusion:</td>
</tr>
<tr>
<td></td>
<td>» Hematological assessment and if needed appropriate non-transfusion therapy pre-operatively</td>
</tr>
<tr>
<td></td>
<td>» Meticulous hemostasis intra-operatively</td>
</tr>
<tr>
<td></td>
<td>» Consider alternatives such as erythropoietin, cell salvage, antifibrinolytic agents</td>
</tr>
<tr>
<td></td>
<td>- Administer red blood cell transfusion one unit at a time in the non-urgent setting, assessing the need for further transfusion after each unit with repeat hemoglobin level and clinical assessment</td>
</tr>
<tr>
<td><strong>With Chronic anemia</strong></td>
<td>- Use transfusion <strong>ONLY</strong> when alternatives do not exist or have proven ineffective</td>
</tr>
<tr>
<td></td>
<td>- Administer red blood cells at intervals to maintain the hemoglobin just above the lowest level necessary to prevent symptoms of anemia</td>
</tr>
<tr>
<td></td>
<td>- Assess long-term transfusion recipients for iron overload and consideration of iron chelation treatment where organ toxicity from transfusion iron overload is anticipated</td>
</tr>
<tr>
<td><strong>With hemoglobinopathies (eg. sickle cell disease, thalassemia) or autoimmune hemolytic anemia</strong></td>
<td>- As goals and principles of transfusion in these patient populations differ significantly from other patients, a hematology consultation is advised prior to proceeding with transfusion</td>
</tr>
<tr>
<td><strong>Selection order of ABO compatible donor red blood cells</strong></td>
<td>- See table 5.3</td>
</tr>
</tbody>
</table>
Table 5.3 Selection Orders of ABO Compatible Donor Red Blood Cells

<td>Procedures associated with blood loss or major surgery (&gt;500 mL expected blood loss)</td>
<td>Transfuse 1 pool immediately before procedure^{38,48}</td>
</tr>
<tr>
<td>&lt;50</td>
<td>Immune thrombocytopenia</td>
<td>Transfuse platelets only with life-threatening bleeding^{49}</td>
</tr>
<tr>
<td>&lt;100</td>
<td>Pre-neurosurgery or head trauma</td>
<td>Transfuse 1 pool of platelets^{50,51}</td>
</tr>
<tr>
<td>Any</td>
<td>Platelet dysfunction and marked bleeding (e.g., post cardiopulmonary bypass). Exception: Transfusing platelets for intracranial hemorrhage not requiring surgical management in patients on antiplatelet agents leads to increased morbidity</td>
<td>Transfuse 1 pool of platelets^{38,52}</td>
</tr>
</tbody>
</table>
ABO/Rh-identical platelets are preferred, but ABO/Rh non-identical platelets may be transfused when ABO/Rh-identical platelets are not available. Rh negative females of child-bearing potential require Rh immunoglobulin (RhIG) when Rh positive platelets are transfused, to avoid formation of anti-D antibody. Each platelet pool contains up to 0.5 mL of RBCs. Each 120 ug of RhIG covers 6 mL RBC, with an effect lasting approximately 21 days.

### 5.3 TRANSFUSION OF FROZEN PLASMA TO ADULTS

The Ontario Clinical Practice Recommendations for the use of Frozen Plasma (FP)

#### SITUATIONS IN WHICH THE TRANSFUSION OF FP IS REASONABLE:

<table>
<thead>
<tr>
<th>CLINICAL SETTING</th>
<th>INR</th>
<th>RECOMMENDATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Significant bleeding</td>
<td>greater than 1.8</td>
<td>3-5 units plasma</td>
</tr>
<tr>
<td>Liver disease coagulopathy AND pre invasive procedure</td>
<td></td>
<td>Note: plasma is not required prior to procedures not associated with blood loss irrespective of INR e.g. paracentesis, thoracentesis, central line placement</td>
</tr>
<tr>
<td>Microvascular bleeding</td>
<td>Unable to wait for results</td>
<td>2 units plasma for every 4 units of RBCs</td>
</tr>
<tr>
<td>Extreme life threatening hemorrhage</td>
<td></td>
<td>Note: If massive transfusion required follow hospital Massive Hemorrhage Protocol</td>
</tr>
</tbody>
</table>

Plasma Exchange | any | Thrombotic thrombocytopenic purpura (TTP) |

Note:
FP should ONLY be considered for warfarin reversal or vitamin K deficiency in the event PCCs are not available, and in the presence of serious bleeding or emergency surgery with INR > 1.5. See section 5.6.

#### SITUATIONS IN WHICH TRANSFUSION OF FP IS NOT USEFUL:

- INR less than 1.8 (including major or non-life-threatening bleeding)*
- Use of 1:1 or 2:1 (RBC:FP) replacement when patient is unlikely to require massive transfusion
- Coagulopathy in the absence of bleeding or need for major emergency surgery
- Minor procedures with any elevation in the INR*
- Elective reversal of warfarin where time allows for warfarin cessation and/or use of vitamin K
- Reversal of anticoagulants (eg: heparin/LMWH, rivaroxaban, dabigatran, apixaban)**
- Volume expansion or “nutrition support”

* Note: Patients with an increased INR do not have an increased risk of bleeding with minor procedures and there is no evidence that transfusing plasma will prevent or reduce bleeding (Paracentesis, thoracentesis, central line insertion, PICC, bone marrow aspiration/biopsy)

** Note: FP has no effect in reversing or neutralizing heparins or thrombin inhibitors: FP should ONLY be used for warfarin reversal if PCC’s are not available

Note: Clinical Practice Recommendations for the use of FP and an order set template can be found at [www.transfusionontario.org](http://www.transfusionontario.org)
5.4 TRANSFUSION OF CRYOSUPERNATANT PLASMA TO ADULTS

Uses include:
- In conjunction with plasma exchange in thrombotic thrombocytopenia or hemolytic-uremic syndrome

<td>less than 2.0</td>
<td>4 grams of fibrinogen concentrate or 10 U of cryoprecipitate</td>
</tr>
</tbody>
</table>

- Treatment of bleeding in patients with von Willebrand disease or Hemophilia A only:
  - when factor concentrates are unavailable (e.g. remote geographic region); and
  - DDAVP is unavailable or ineffective
- Factor XIII deficiency when factor concentrates are not available

REFERENCES
26. CBS, Circular of Information.

Note: A comprehensive list of references to guidelines for transfusion medicine practice can be found at the ORBCoN website at www.transfusionontario.org
5.6 USE OF PROTHROMBIN COMPLEX CONCENTRATES (PCCs)

PCCs have replaced frozen plasma as the product of choice for emergency reversal of warfarin effect or vitamin K deficiency. Products available are Octaplex® and Beriplex®.

Indications for use of PCCs

- Emergency reversal of warfarin effect.
  - For patients with INR ≥1.5 AND
  - “Life or limb” threatening bleeding
  - Emergency surgery within 6 hours
  Give:
  - Vitamin K 10mg IV
  - PCC according to INR (see below)
- PCCs should NOT be administered if:
  - INR ≤1.5 as individual coagulation factors are not below the level needed to maintain hemostasis
  - Patients with coagulopathies not related to warfarin or Vitamin K deficiency as they are deficient in coagulation factors not contained in PCCs (with the exception of the off-label uses described)
  - Patients with known HIT (Beriplex® and Octaplex® both contain heparin)
  - Patient has received or will receive recombinant Factor VIIa
- Its use should be limited to life-threatening hemorrhage and patients requiring emergency surgery.

Dosage

- The National Advisory Committee on Blood and Blood Products (NAC) Recommendations on dosing are based on the INR as detailed in the table to the right.
- If the INR is unknown and major bleeding is present, 2,000 IU (80mL) should be administered.
- The published NAC Recommendations include a table of detailed dosages based on a combination of INR and body weight, as an alternative dosing strategy.
- The maximum dose should not exceed 3,000 IU.
- Infusion rate should not exceed 3 mL/min for Octaplex® and 8 mL/min for Beriplex®.

</tbody>
</table>

Off-Label Uses of PCCs

- Reversal of anti-Xa inhibitors (Rivaroxaban and Apixiban).
- Currently specific reversal agents are in clinical trials and are not available outside of clinical trials
- PCCs at a dose of 2,000 IU (repeated in 1 hour if hemostasis is not achieved) is being used across Canada
- Data to support its use is limited to studies in animals and human volunteers
- A licensed antidote to dabigatran (Idarucizumab, Praxbind®) is available in Canada
- The dose of Idarucizumab is 5 g, administered in two 2.5 g bolus infusions each over 5 minutes, not more than 15 minutes apart

REFERENCES

6.0 SPECIAL PRODUCT SELECTION

## 6.1 PLATELET SELECTION

| Policy | • The Transfusion Medicine Service will provide group-specific platelets whenever possible within the constraints of availability and urgency  
• Policies should be established for providing non-group specific platelets when group-specific component is not available. Such policies shall be incorporated into appropriate processes and technical procedures  
Note: Major or minor incompatible platelet component should not be issued to prevent outdate or wastage when group specific platelets are available, unless strategies are in place for prevention of hemolytic reactions |
| Reason | • Mitigate the risk of hemolytic reactions to high titre anti-A or anti-B alloantibodies when group O platelets are given to a non-group O recipient, and to prevent immunization of group RhD negative recipients by transfusion of RhD positive component, particularly those of child-bearing potential  
• The true incidence is difficult to quantify due to under-recognition, but is in the order of magnitude of 1:100 to 1:9,000. Depending on the method used and the definition of high titre, approximately 10-40% of group O platelets contain high titres of isoagglutinins |
| Applies to: | • All patients receiving platelets for whom group specific platelets are not available within an acceptable time frame |
| Responsibilities of the Medical Director, Transfusion Medicine | • Establish policy, processes and procedures for:  
  » Provision of non-group specific platelets when group specific platelets are not available informing the ordering MD and patient about signs and symptoms of hemolytic transfusion reactions  
  » Consideration of the titration of anti-A and anti-B in situations when group O platelets are to be given to non-group O recipients  
  » Reduction of risk of acute hemolytic transfusion reaction by plasma volume reduction or avoidance of high anti-A or anti-B titre component  
• Consult as required with clinical staff on individual cases |
| Responsibilities of Transfusion Medicine Service Staff | • Follow prescribed technical procedures  
• Consult with Medical Director, Transfusion Medicine (or delegate) as indicated in procedures, or by clinical circumstances |
### 6.2 CLINICAL PRACTICE RECOMMENDATIONS FOR THE USE OF NON-ABO SPECIFIC PLATELETS

<table>
<thead>
<tr>
<th>Purpose</th>
<th>These recommendations were developed by ORBCoN in collaboration with an expert working group to assist clinical decision making for the use of non-ABO or non-RhD type specific platelets when ABO/RhD type specific platelets are not readily available.</th>
</tr>
</thead>
</table>
| Guideline | Prior to use of these recommendations the following should be considered  
- There is evidence to suggest that ABO type specific platelets will result in higher platelet increment  
- There is no definitive evidence to suggest that adverse events or mortality are different with ABO type specific platelets or ABO non type specific, plasma compatible platelets  
- If ABO plasma compatible platelets are not available, group O platelets may be transfused to a non-O recipient so long as the ordering physician is informed to enable appropriate monitoring of the patient for signs of hemolysis  
- A trial of ABO type specific platelets should be given to patients who are refractory prior to screening for HLA antibodies  
- All institutions should have a policy to address the use of Rh positive platelets for Rh negative recipients including whether Rh Immune globulin (RhiG) will be administered |
| Recommendation | • ABO and Rh type specific platelets should be used when available  
• ABO plasma compatible platelets are a reasonable substitute when ABO type specific platelets are not available  
• Patients who require long term platelet support should ideally receive ABO type specific platelets  
• RhD positive platelets may be given to RhD negative recipients when RhD negative platelets are not available. RhD negative females of child bearing potential require Rh immunoglobulin (RhiG) when RhD positive platelets are transfused |
| Other Considerations | • There have been cases of hemolysis following transfusion of ABO plasma incompatible platelets containing high titre isohemagglutinins  
• Buffy coat platelets and apheresis single donor platelets contain approximately 250-300mL of plasma from one donor whose isohemagglutinin titre is unknown  
• Titration of ABO isohemagglutinins is of questionable value due to poor predictability between in vitro titres and red blood cell survival. The test is difficult to standardize and there is no reference to support the use of platelets beyond a certain level of titration  
• ABO plasma incompatible platelets can be volume reduced by centrifugation and removal of supernatant plasma |

47. Dunbar NM, 2012.  
Algorithm for the use of Non-ABO/Rh Type Specific Platelets

Each institution should have a policy to address use of RhIg when Rh Neg patients receive Rh Pos platelets, particularly when the patient is a female of child bearing potential.

Order for platelets received for appropriate clinical indication

Is requirement URGENT?

Contact CBS – are ABO/Rh type specific platelets available in time?

Issue available platelets according to patient group:

Rh
1. Rh Neg receive Rh Neg according to institutional policy

ABO
2. Group O gets O>B>A>AB
   Group A gets A>AB>B>O
   Group B gets B>AB>A>O
   Group AB gets AB>A>B>O

ABO/Rh type specific platelets available

Issue ABO/Rh type specific platelets

YES

ABO/Rh type specific platelets available

YES
6.3 SPECIAL CIRCUMSTANCES

<table>
<thead>
<tr>
<th>RhD positive platelets for RhD negative recipient</th>
</tr>
</thead>
<tbody>
<tr>
<td>• When possible only RhD negative platelets should be given to RhD negative patients</td>
</tr>
<tr>
<td>• RhD negative females with child-bearing potential should preferentially receive RhD negative platelets</td>
</tr>
<tr>
<td>• If RhD positive platelets must be transfused to females of childbearing potential, post-transfusion treatment with RhIG is recommended (note that each platelet pool contains up to 0.5 mL of red cells and that each 120 ug of RhIG covers 6 mL red cells and lasts approximately 21 days)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ABO and HLA matched component required</th>
</tr>
</thead>
<tbody>
<tr>
<td>• HLA/HPA match usually takes precedence over ABO match</td>
</tr>
<tr>
<td>• If a group O, HLA/HPA matched component for a non-group O recipient is known to have a high titre anti-A or anti-B and plasma volume reduction is not possible, consultation with the Medical Director, Transfusion Medicine (or delegate) is required before release for transfusion</td>
</tr>
<tr>
<td>• CBS should be informed so that an alternate ABO group HLA/HPA match donor can be sought</td>
</tr>
</tbody>

### 6.4 PLATELET REFRACTORINESS AND INDICATIONS FOR HLA MATCHED PLATELETS

<table>
<thead>
<tr>
<th>Policy</th>
<th></th>
</tr>
</thead>
</table>
| • The Transfusion Medicine Service provides HLA matched platelets for appropriate patient populations whenever possible  
• The procedures for evaluation of requests for HLA matched platelets involves availability of information to identify patients who require these components, in case that information is not known to the ordering physician  
• The requirement for HLA matched platelets is placed on the Transfusion Medicine Service patient record, and these records are always to be checked as part of the evaluation of product request procedures  
|  |
| Reason |  |
| • Provision of specialized platelet component for thrombocytopenic alloimmunized patients, refractory to platelet transfusion  
|  |
| Responsibilities of the Medical Director, Transfusion Medicine |  |
| • Ensure a process is in place to identify patients who are refractory to platelet transfusion  
• Ensure there is a process in place to manage requests for HLA matched platelets  
• Establish hospital policy for screening of requests and appropriate communication with CBS  
• Be aware of HLA matched recipients and requests for HLA matched platelets  
• Ensure policies, processes and procedures are in place to confirm effectiveness of HLA-matched platelets and to discontinue their use if ineffective  
• Consult with and promote education of treating physicians in the management of platelet refractoriness  
|  |
| Responsibilities of Transfusion Medicine Service Staff |  |
| • Follow established written technical procedures  
• Consult with Medical Director, Transfusion Medicine (or delegate) as indicated in procedures or circumstances  
• Report any instances where HLA matched platelets were not given to a patient meeting criteria for HLA matched platelets  
|
### 6.5 CLINICAL PRACTICE RECOMMENDATIONS FOR MANAGEMENT OF PLATELET REFRACTORINESS

#### Purpose

These recommendations were developed by ORBCoN in collaboration with an expert working group to assist clinical decision making regarding the appropriate use of HLA matched single donor platelets. The provision of HLA matched single donor platelets is resource intensive both from a blood supplier perspective, and that of the initiating institution, and should be reserved for HLA sensitized patients proven to be refractory to random donor platelets.

*Note: when considering these guidelines, the following should be observed:*

- There is no evidence that any one patient group will benefit from the use of single donor platelets in the absence of HLA or HPA refractoriness
- Leukoreduced (LR) buffy coat platelets and LR single donor apheresis platelets, should be used interchangeably for non-refractory patients

#### Guideline

HLA matched platelets are exclusively indicated for refractory patients with demonstrated HLA antibodies. Criteria for determining platelet refractoriness in patients with HLA alloimmunization:

- 10-60 minute increment $<10 \times 10^9 /L$ following at least two infusions of ABO-identical platelet transfusions **and**
- Positive antibody screen for HLA-alloantibodies

#### Recommendation

- Single donor apheresis platelets should be released based on CBS supply and hospital demand for platelet products

#### Other considerations

**Other considerations:**

- Other causes of non-immune refractoriness are identified and treated
- Communication with clinical and CBS teams to make sure platelets only collected when needed is key to maintaining adequate supply/demand

---

**REFERENCES**

### 6.6 CMV SERONEGATIVE RED BLOOD CELLS AND PLATELETS

| **Policy** | • Since October 2017 CBS has provided CMV seronegative components for intrauterine transfusion only |
| **Reason** | • Leukoreduced cellular components have a very low residual risk of transfusion-transmitted CMV  
• It is unknown if CMV seronegative units have any additional benefit to leukoreduction  
• Both CMV seronegative and leukoreduced cellular components are considered “CMV safe” |
| **Responsibilities of the Medical Director, Transfusion Medicine** | • Be familiar with the indications for CMV seronegative products  
• Establish a policy for the provision of CMV seronegative products  
• Consult with, and provide information to clinical and Transfusion Medicine Staff regarding the appropriate uses of CMV seronegative components  
• Discuss risks and benefits with treating physicians when CMV seronegative component is indicated but unavailable |
| **Responsibilities of Transfusion Medicine Service staff** | • Follow associated technical procedures  
• Consult Medical Director, Transfusion Medicine (or delegate) as indicated in procedures or by circumstances  
• Report all instances where a CMV seronegative component is not given to a patient who met criteria |
6.7 INDICATIONS FOR USE OF CMV SERONEGATIVE RED BLOOD CELLS AND PLATELETS

<table>
<thead>
<tr>
<th>Purpose</th>
<th>CBS provides CMV seronegative components for intrauterine transfusion only.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Guideline</td>
<td>If CMV seronegative components are not readily available and a delay in transfusion would compromise patient care, transfusion may proceed with CMV unscreened blood components at the discretion of the primary physician.</td>
</tr>
<tr>
<td>Recommendation</td>
<td>• Intrauterine transfusions</td>
</tr>
<tr>
<td>Other considerations</td>
<td>• All institutions shall have a policy for the appropriate use of CMV seronegative components</td>
</tr>
</tbody>
</table>

NAC’s statement regarding appropriateness of use of Cytomegalovirus (CMV) seronegative vs “CMV safe” component

The NAC statement regarding CMV safe blood components can be seen at: http://www.nacblood.ca/resources/guidelines/CMV.html.

Unavailability of Leuko-Reduced Blood Products
In the event Canadian Blood Services cannot supply leuko-reduced products, CMV seronegative product will be provided and should be prescribed for patients in the following situations:

1. CMV seronegative allogeneic bone marrow transplant candidates and/or recipients of CMV seronegative donor marrow/stem cell recipients.
2. CMV seronegative autologous stem cell transplant candidates.
3. CMV seronegative recipients of organs from CMV seronegative donors.
4. Pregnant women (except those imminently about to deliver).
5. Intrauterine transfusions.
6. Transfusion of infants of mothers who are CMV seronegative or unknown CMV serological status.
7. HIV positive patients who are CMV seronegative or of unknown CMV serological status.

## 6.8 IRRADIATED BLOOD COMPONENTS

| **Policy** | • The Transfusion Medicine Service provides irradiated blood components for appropriate patient populations whenever possible  
• The procedures for evaluation of requests for blood components contains information to identify patients who require irradiated products, in the event it is not recognized by the ordering physician  
• The need for irradiated products is placed on the Transfusion Medicine Service patient record and these records are always checked as part of the evaluation of product request procedures |
| **Reason** | • Irradiating blood components reduces the risk of transfusion associated graft-versus-host disease (TA-GvHD), where donor cells mount an immune response in an immunologically compromised recipient  
• Prevention of TA-GvHD is particularly important in view of the high associated mortality  
• The Transfusion Medicine Service record check provides additional security that a patient receives the appropriate blood components |
| **Responsibilities of the Medical Director, Transfusion Medicine** | • Be familiar with the indications for irradiation of blood components.  
• Consult with, and provide information to, clinical and Transfusion Medicine staff on the appropriate uses of irradiated blood components  
• Ensure that an explanation is given to the patient of the reason for the use of irradiated component, and the possible consequences of not receiving irradiated component  
• Ensuring that the patient has, in writing, a statement of requirement for irradiated component (e.g. wallet card with essential information) |
| **Responsibilities of Transfusion Medicine Service staff** | • Follow associated technical procedures  
• Consult with Medical Director, Transfusion Medicine (or delegate) as indicated  
• Report all instances where irradiated blood components were not given to a patient who met criteria |
| **Applies to:** | • Specific populations of patients listed in table 6.1. Every attempt should be made to ascertain the patient’s purine analogue drug status  
• Where there is doubt, irradiated blood components should be transfused  
• If irradiated blood components are not readily available and delay in transfusion could compromise patient care, transfusion may proceed at the discretion of the patient’s attending physician. Consideration should be given to using components older than 14 days if irradiated components are not available and transfusion is urgently required |
Table 6.1 Recommended Indications for the Use of Irradiated Components

<table>
<thead>
<tr>
<th>PATIENTS REQUIRING IRRADIATED BLOOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Patients with severe T-cell congenital immunodeficiency states</td>
</tr>
<tr>
<td>• Intrauterine transfusions (IUT)</td>
</tr>
<tr>
<td>• Neonatal exchange transfusions for infants with prior IUT</td>
</tr>
<tr>
<td>• Neonatal top-up transfusion if there has been a previous IUT</td>
</tr>
<tr>
<td>• Patients with Hodgkin’s lymphoma</td>
</tr>
<tr>
<td>• Patients undergoing bone marrow or stem cell transplants</td>
</tr>
<tr>
<td>» It is reasonable to continue providing irradiated products until immunosuppression discontinued</td>
</tr>
<tr>
<td>• Recipients of directed transfusions from family members</td>
</tr>
<tr>
<td>• Recipients of HLA-matched platelets</td>
</tr>
<tr>
<td>• Patients treated with purine analogs (e.g., fludarabine), purine antagonists (e.g., bendamustine), alemtuzumab and anti-thymocyte globulin</td>
</tr>
</tbody>
</table>

### 6.9 WASHED RED BLOOD CELLS AND PLATELETS

| **Policy** | • The Transfusion Medicine Service provides washed cells for appropriate patient populations, when possible  
• The procedure for evaluation of a request for washed red blood cells contains information to identify patients who require these components, in the event that it is not recognized by the ordering physician  
• The need for washed cells is placed on the Transfusion Medicine Service patient record, and these records are always checked as part of the evaluation of component request procedures  
• Orders for washed platelet components should be discussed with a medical expert in Transfusion Medicine |

| **Reason** | Red blood cell units and platelets are washed to remove plasma or additive solutions for patients identified in the indications section below |

| **Applies to** | Patients for whom contents in the plasma or additive solution have been shown to, or may, cause morbidity |

| **Responsibilities of the Medical Director, Transfusion Medicine** | • Be familiar with the indications for the need and use of washed red blood cells and platelets  
• Be familiar with the process to obtain washed red blood cells from CBS (washed platelets are not available through CBS)  
• Ensure a process is in place to handle requests  
• Consult with, and provide information to, clinical and Transfusion Medicine staff on appropriate uses of washed red blood cells and platelets  
• According to hospital policy, the Medical Director, Transfusion Medicine may need to screen all requests for washed components, or it may be appropriate for ordering physicians to consult directly with CBS physicians |

| **Responsibilities of Transfusion Medicine Service staff** | • Follow associated technical procedures  
• Consult with Medical Director, Transfusion Medicine (or delegate) as indicated in procedures or by circumstances  
• Report all instances where washed red blood cells or platelets were not given to a patient who met the criteria |
## 6.10 INDICATIONS FOR WASHED RED BLOOD CELLS

<table>
<thead>
<tr>
<th>Indications for washed red blood cells</th>
<th>For removal of plasma/platelets when transfusing red blood cells to recipients who are:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Known to have a history of severe or repeated allergic reactions to plasma contents, which are unresponsive to pre-medication</td>
</tr>
<tr>
<td></td>
<td>• HPA-1 negative with anti-HPA-1</td>
</tr>
<tr>
<td></td>
<td>• History of anaphylactic transfusion reaction associated with anti-IgA antibodies, when IgA deficient blood products are not available</td>
</tr>
<tr>
<td>Note:</td>
<td>while IgA deficiency is common (1 in 700), only a fraction of these patients will make an anti-IgA antibody, and a smaller fraction again will develop anaphylactic transfusion reactions. Because IgA-deficient and washed blood products are difficult to source, investigation for anti-IgA antibodies is generally only advised for patients who have actually had an anaphylactic transfusion reaction. Testing for IgA deficiency is available through CBS (refer to <a href="http://www.blood.ca">www.blood.ca</a>). As most patients with a history of anaphylactic transfusion reactions do not have anti-IgA antibodies, provision of IgA deficient blood products is not advised while awaiting results of testing</td>
</tr>
<tr>
<td>For removal of additive solution:</td>
<td>• Neonates undergoing exchange or massive transfusion</td>
</tr>
<tr>
<td></td>
<td>• Repeated febrile non-hemolytic transfusion reactions despite adequate pre-medication</td>
</tr>
<tr>
<td></td>
<td>• Repeated urticarial reactions despite adequate pre-medication</td>
</tr>
</tbody>
</table>

## 6.11 INDICATIONS FOR WASHED OR PLASMA DEPLETED PLATELETS

<table>
<thead>
<tr>
<th>Indications for washed or “concentrated” platelets</th>
<th>Orders for washed platelet components should be discussed with a medical expert in Transfusion Medicine</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Washed platelets are rarely indicated</td>
</tr>
<tr>
<td></td>
<td>• Washing platelets to remove incompatible plasma may result in significant loss of platelets in addition to promoting platelet activation. The resulting component is likely to have reduced effectiveness</td>
</tr>
</tbody>
</table>

## REFERENCES

2. AABB, 2017.

## 6.12 EMERGENCY RELEASE OF RED BLOOD CELL UNITS

| Policy during regular working hours | - Transfusion Medicine staff will issue group O red blood cells in emergency situations when compatibility examinations cannot be done or results are not yet available, and the patient requires immediate red blood cell transfusion  
- RhD negative females of child bearing potential (each hospital should establish an age) should preferentially receive RhD negative components  
- If RhD negative red blood cells are not available the Medical Director, Transfusion Medicine (or delegate) should be contacted immediately  
- A policy should be in place to address the administration of RhIG when RhD positive platelets or red blood cells are transfused to an RhD negative recipient  
- The requesting physician must sign for the emergency release of red blood cells on the request or patient record, as provided for in CSA Standards  
- Group-specific red blood cells are **never** released on the basis of the blood group in the patient record, as provided for in CSA Standards, group O cells will be transfused until the patient’s ABO and RhD group have been determined on two separate samples (see section 4.2) |
| --- |

| Policy (outside of regular laboratory hours) | - Transfusion Medicine Service staff will establish a procedure for the Emergency release/issue of blood products by clinical personnel to include provision that:  
  » Only trained and competent clinical personnel are approved to release/issue blood products from the laboratory or other specific locations where such units are stored within the facility  
  » Clinical personnel who do this task will have their competence assessed at regular, defined intervals  
  » Results of such competence assessment will be recorded as part of the employee record  
  » Names and signatures of such clinical staff will be on record in the Transfusion Medicine Service |
| --- |

| Reason | The clinical urgency of the emergency situation does not allow time to undertake or complete regular compatibility examinations. |
| --- |

| Applies to: | Patients who require red blood cell transfusion before grouping and compatibility examinations are complete. |
| --- |

| Responsibilities of the Medical Director, Transfusion Medicine | - Develop the policy, process and procedures for emergency release of blood, including the capability to:  
  » Perform STAT examinations  
  » Provide consultation to clinical staff  
  » Avoid unnecessarily restrictive practices  
  » Ensure timely or immediate availability of red blood cells to meet the needs of the requesting clinical service  
- Consult with Transfusion Medicine and clinical staff as needed  
- If a crossmatch completed during or after transfusion has occurred appears incompatible, immediately inform the treating physician(s) to minimize and manage any adverse reaction |
### Responsibilities of Transfusion Medicine staff

- Follow the procedures in the Emergency Release of Group O and Group Specific Red Blood Cells process
- Provide component as promptly as possible during the emergency
- Consult with supervisor or Medical Director, Transfusion Service (or delegate) as needed
- It is recognized that documentation often occurs after transfusion, due to clinical urgency, but the Transfusion Medicine Service must insist upon:
  - Strict identification of donor units and patient samples even in the case of “unidentified” patients
  - Documentation of unit disposition
  - Documentation of the emergency status of the transfusion
  - Signature of the requesting physician that emergency release of component is required
- If possible a serologic crossmatch should be performed on units transfused under Emergency Release procedures

### Crossmatch

- The Transfusion Medicine Service should retain/obtain samples from the transfused uncrossmatched units and perform compatibility examinations when patient plasma/serum samples are available
- Such compatibility testing should reflect the routine pre-transfusion methods, including an antibody screen, and proceeding to direct crossmatch versus bag segments only if antibody screen is positive
- If the subsequent crossmatch is incompatible, the Medical Director, Transfusion Medicine (or delegate) must immediately inform the treating physician to minimize and manage any adverse reaction
- Investigation of any blood transfused prior to arrival / testing should be done (prior hospital treatment or transfused en route to hospital)
- If mixed field is detected in ABO/Rh testing and blood group cannot be clearly determined, group O red blood cells should be issued until the discrepancy can be resolved (RhD type should be determined based on age and gender of the recipient)

### Responsibilities of the treating physician

- Ensure a blood sample is obtained prior to transfusion or as soon as possible after transfusion has commenced if transfusion has already begun
- Ensure required procedures for positive patient identification and specimen labeling are followed
- Sign the request for emergency release of red blood cell units

### Responsibilities of treating nurse

- Trained and competent in the emergency issue of red blood cell units if the Transfusion Medicine laboratory is not staffed, or from a storage location other than the Transfusion Medicine laboratory
- Dispatch the patient pre-transfusion sample to the Transfusion Medicine laboratory as soon as possible
<table>
<thead>
<tr>
<th>Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>• RhD negative red blood cells should be used for females of child bearing potential</td>
</tr>
<tr>
<td>• A switch to group-specific uncrossmatched blood should be possible within 15-30 minutes, provided appropriate pre-transfusion sample(s) has (have) been received and tested according to hospital policy, to conserve group O inventory</td>
</tr>
<tr>
<td>• There is no threshold of units of group O RBCs above which a switch to group specific RBCs is prohibited</td>
</tr>
<tr>
<td>• Cross-matched blood according to the routine procedures should be issued as soon as possible, subject to the immediately preceding policy statement</td>
</tr>
<tr>
<td>• A policy should be established for the release of blood to transport personnel for both identified and unidentified patients and should include:</td>
</tr>
<tr>
<td>» Instructions for packing, labeling and transport</td>
</tr>
<tr>
<td>» Notification of the receiving facility when known</td>
</tr>
<tr>
<td>» Contact information of the sending facility</td>

7.0 APPROPRIATE USE OF MANUFACTURED BLOOD PRODUCTS

<table>
<thead>
<tr>
<th>Policy</th>
<th>The Transfusion Medicine Service follows established guidelines for use of all blood products.</th>
</tr>
</thead>
</table>
| Reason | • Assist in the efficacious use of blood products  
• Improve patient safety by providing the appropriate product at the right dosing schedule |
| Patient population | • As indicated in subsequent sections concerning individual products |
| Responsibilities of the Medical Director, Transfusion Medicine | • Be familiar with the appropriate use of these products  
• Assist in utilization management of these blood products by:  
  » Developing policies, processes and procedures to screen requests for these products to ensure that the most appropriate product is used in the right dose  
  » Promote education of clinical and other staff in the appropriate use of these products  
  » Assist clinicians when orders deviate from established guidelines and dose recommendations |
| Responsibilities of the treating physician | • Obtain any necessary authorization or special product release |
| Responsibilities of Transfusion Medicine Service staff | • Follow associated technical procedures as written  
• Consult with the Medical Director, Transfusion Medicine (or delegate) as indicated in procedures, as necessary based on technologist’s skills and experience, or on the basis of available clinical or laboratory information  
• Report all instances where these products were not given to a patient who met criteria  
• Provide any required request forms and/or contact information needed to obtain appropriate authorization |
| Associated documents | Ontario guidelines have been developed for the following:  
• IVIG  
• Albumin  
Refer to: [www.transfusionontario.org](http://www.transfusionontario.org)  
National guidelines have been developed for the following:  
• Prothrombin Complex concentrates (PCC)  
• Solvent/detergent-treated plasma  
• Recombinant FVIIa  
• Fibrinogen Concentrates  
Refer to: [www.nacblood.ca](http://www.nacblood.ca) |

7.1 APPROPRIATE USE OF PLASMA FRACTIONATED PRODUCTS

Plasma fractionated products include:  
• Albumin  
• Intravenous immunoglobulin (IVIG)  
• Subcutaneous immunoglobulin  
• Specific immune globulins (RhIG, SCIG, HepBIG, VZIG)  
• Human derived clotting factor concentrates (FEIBA, PCC, FXI, fibrinogen concentrates)  
• Recombinant clotting factors (FVII, VIII, IX, FXIII)

7.2 INDICATIONS FOR THE USE OF ALBUMIN

7.3 INDICATIONS FOR THE USE OF INTRAVENOUS IMMUNOGLOBULIN (IG)

**General Pre-requisites and indications for IVIG or SCIG Use:**
1. A diagnosis must be confirmed for all orders.
2. For immune deficiency conditions, serum IgG levels must be clinically assessed to ensure optimum dosing.
3. For all other conditions, IVIG should only be used when other, less expensive, equally safe and efficacious alternatives have failed.
4. There must be regular clinical outcome assessment.
5. For all proposed treatments or course of treatments with IVIG and SCIG the MOHLTC IG Request Form (see below) shall be completed by the requesting physician.
6. All request forms must be reviewed for appropriate indication and dosage interval.
7. Detailed information on all aspects of IG Utilization Management can be found in the Immune Globulin Toolkit prepared by ORBCoN.

**Special Requests for Use in Conditions not on the list of Approved Medical Conditions for IG Use:**
- Subject to screening at the hospital level:
  - IG user hospitals shall select the appropriate physician/committee to review, and where appropriate, approve requests for indications not listed on the MOHLTC IG Request Form
  - The physician appointed to serve as the approving physician (or delegate) shall sign the request form
  - On the request form under the heading “Other” the non-licensed indication shall be entered
- In the event of urgent treatment in a life-threatening situation, the request for IVIG shall be met immediately following verification of appropriate dose

**Approved Indications for IG Treatment**
The clinical indication, dose and duration of therapy must be in accordance with the Ontario IG Utilization Management Guidelines.

**Indications for which IG is NOT recommended nor indicated, or is ineffective:**

<table>

IVIG dose calculation:

- An IVIG Dose Calculator based on adjusted body weight is available to determine the appropriate dose for each individual patient.
- Available at [http://ivig.transfusionontario.org](http://ivig.transfusionontario.org) and as an application for installation on hand-held electronic devices.
- Based on patient height and weight.
- For IVIG for immunoglobulin replacement, use dose calculator for 1st dose and determine subsequent doses based on the IgG trough level.
- Preparations of immunoglobulin are available from Canadian Blood Services. Dosage is individualized, consult package insert.

### 7.4 USE OF RECOMBINANT FACTOR VIIA, ERYTHROPOIETIN

**Policy**

The Transfusion Medicine Service follows established guidelines for use and dosage of recombinant products for the purposes outlined below.

The Medical Director, Transfusion Medicine has established a process to screen requests for recombinant products. This process includes creation and maintenance of a record of the patient response to therapy and outcome.

All first time requests for recombinant factors must be approved by the Medical Director, Transfusion Medicine to address the issue of “off-label” use of recombinant factor VIIa.

**Applies to**

- Recombinant Factor VIIa:
  - Control of bleeding in congenital factor VII deficiency
  - Patients with hemophilia A and B with coagulation factor inhibitors
  - Patients with acquired coagulation factor inhibitors refractory to medical therapy
  - Not recommended for treatment of bleeding in patients without the disorders listed above
### Responsibilities of the Medical Director, Transfusion Medicine

- Be familiar with the availability and use of recombinant products and be aware that:
  - NAC guidelines recommend against off label use
  - Random controlled trials do not support off label use
  - Risk of adverse event is doubled over age 65 and tripled over age 75
- Understand the indications for and use of erythropoietin in the management of peri-operative patients and for patients who refuse blood transfusion
- Ensure effective use of recombinant products by:
  - Screening requests for recombinant products
  - Promoting education of treating physicians and other health care professionals in the appropriate use of recombinant products
- Manage the inventory by:
  - Determining if the patient population served warrants holding a supply of these products as part of regular inventory, or should be requested from Canadian Blood Services on an *ad hoc* basis
  - Ensuring recirculation for expiring products in a timely fashion

### Responsibilities of Transfusion Medicine Staff

- Follow associated technical procedures as written
- Respond promptly to requests where there life-threatening hemorrhage
- Insist that proper documentation is followed
- Order, receive and issue recombinant products
- Contact the Medical Director, Transfusion Medicine on receiving first-time requests for recombinant products
- Be aware that for all off-label requests for refractory bleeding:
  - NAC guidelines recommend against off label use
  - Random controlled trials do not support off label use
  - Risk of adverse event is doubled over age 65 and tripled over age 75

### Conditions

- Recommended dosing for recombinant factor VIIa for:
  - Inhibitor patients - 70-90u/kg 2 hourly
  - Congenital factor VII deficiency – 15-30u/kg 4-6 hourly

### Erythropoietin

Although erythropoietin is not distributed through the Transfusion Medicine Service, the Medical Director, Transfusion Medicine should be familiar with the drug and its indications for use in the peri-operative period and for patients who refuse blood transfusion.

### 8.1 Neonatal Red Blood Cell and Platelet Transfusion

<table>
<thead>
<tr>
<th>Policy</th>
<th>The Transfusion Medicine Service follows established policies, processes and procedures for transfusion of blood components and products to neonatal patients.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason</td>
<td>Indications for transfusion and specific requirements for neonates are different from transfusion requirements for those over 4 months of age.</td>
</tr>
</tbody>
</table>
| Responsibilities of the Medical Director, Transfusion Medicine | • Be familiar with indications for neonatal transfusion and be available for consultation with treating physicians  
• Ensure guidelines are readily available in institutions with neonates |
| Responsibilities of Transfusion Medicine Service Staff | • Follow associated technical procedures as written  
• Consult with the Medical Director, Transfusion medicine (or delegate) as indicated by procedures or circumstances  
• Ensure requests for blood products meet hospital guidelines for indications and dosage |

### 8.2 Neonatal Patient Management

| General Considerations | • A neonate is considered to be an infant up to 4 months of age  
• There is conflicting evidence for restrictive transfusion practices and for an effect on the long-term neurodevelopmental outcome in preterm infants exposed to severe anemia  
• Desirable hemoglobin levels vary with clinical circumstances (see table 8.1)  
• Transfusion solely to replace blood removed for laboratory tests is not recommended  
• All neonates should receive CMV-safe components |
| Red Blood Cell Dosage and Type | 10-15mL/kg body weight packed red blood cells that are:  
• Compatible with mother and neonate  
  » ABO group specific where possible  
  » Irradiated if previous intrauterine transfusion up to 40 weeks gestational age, exchange transfusion, complex cardiac abnormality until congenital immunodeficiency has been ruled out, massive transfusion (not necessary for low volume transfusion). |
| Massive Transfusion in a neonate (including exchange transfusion) | • In addition to meeting the criteria in section above, units should be negative for hemoglobin S. |
| Compatibility Testing – Initial Pre-transfusion Examination | • Cord blood should not be used for pre-transfusion examinations  
• Required examinations include determination of ABO/RhD and  
• Antibody screen on a sample from the neonate or mother  
  » If clinically significant antibody(ies) are identified, the neonate must receive antigen negative units, compatible by antiglobulin crossmatch, until the antibody is no longer detectable in the infant’s serum/plasma |
| Compatibility Testing – Subsequent Pre-transfusion Examinations | • If the initial antibody screen is negative, repeat examination for unexpected antibodies may be omitted during the current hospital admission, up to 4 months of age. (Alloimmunization in a neonate is unlikely)  
• If a non-group O neonate needs to receive non-group O red blood cells that are incompatible with the maternal ABO group, the neonate’s serum/plasma should be examined for anti-A or anti-B by antiglobulin testing, and compatible blood should be used |

### 8.4 Transfusion of Frozen Plasma to Pediatric Patients

#### Appropriate Uses Include:
- In conjunction with vitamin K for emergency reversal of warfarin effect in a patient requiring an urgent operative procedure or with life-threatening bleeding if Prothrombin Complex Concentrates are not available*.
- Active bleeding or major surgery with PT/aPTT results >1.5 x mid-range of age-related reference range
  - In the absence of heparin, LMWH, lepirudin, hirudin, or other FXa inhibitor, or lupus inhibitor
- Massive transfusion and clinical status precludes waiting for PT/aPTT results
- Acute DIC with bleeding
- Cardiopulmonary bypass procedures with hemorrhage and PT/PTT > 1.5 x mid-range of age-related reference range
- Preparation of reconstituted whole blood for exchange transfusion in neonates
- Hepatic failure with INR >1.5 and major bleeding or invasive procedure (other than para or thoracocentesis)
- Single coagulation factor deficiencies when alternative specific factor concentrates are not available (e.g. factor V, patient at remote location)
  - Specific factor concentrates should be made available as soon as possible, if necessary by transferring the patient to a centre where appropriate concentrates are available
- Rare plasma protein deficiencies for which alternative therapy is not immediately available (e.g. C1 esterase deficiency)
- Thrombotic thrombocytopenic purpura
  - Slow continuous transfusion while awaiting access to exchange transfusion

#### Inappropriate Uses Include:
- Hypovolemia
- Treatment of immunodeficiency states

*Note added in proof: “Dosage schedule for Prothrombin Complex Concentrate based on patient weight over 35 kg is provided in the National Advisory Committee Recommendations"*

For children under 35kg anecdotal evidence suggests that Prothrombin Complex Concentrate is dosed as follows:
- <10 kg INR <3, 250 IU; INR ≥ 3, 500 IU
- 10-25 kg INR <3, 500 IU; INR ≥ 3, 750 IU
- 25-35 kg INR <3, 750 IU; INR ≥ 3, 1,000 IU

8.5 TRANSFUSION OF PLATELETS TO PEDIATRIC PATIENTS MORE THAN 4 MONTHS OF AGE

Dose:
- Body weight <10kg: 5-10ml/kg apheresis or buffy coat platelets should increase platelet count 50 – 100 $\times 10^9$/L
- Body weight $\geq$10kg: 1 unit/10kg of apheresis or buffy coat platelets should increase platelet count 50 – 100 $\times 10^9$/L

8.6 MANAGEMENT OF CONGENITAL ANEMIAS (see also section 9, Special Transfusion Situations)

Policy

The Transfusion Medicine Service has established policies, processes and procedures to assist in the management of patients with congenital anemias that include the provision of phenotypically matched units when appropriate.

Reason

Transfusion thresholds and indications for transfusion in patients with sickle cell syndromes, congenital hemolytic anemias or thalassemia syndromes may be different from those with other causes of anemia.

Responsibilities of the Medical Director, Transfusion Medicine

- Be familiar with the management of transfusion in patients with congenital anemias
- Work in consultation with clinical staff in individual cases
- Work in consultation with clinical staff to determine patient blood group phenotypes and decide on the optimal phenotype of units chosen for ongoing transfusion support
- Establish policies and procedures for the provision of special products including: irradiated components, Hg S negative red blood cells
- and phenotypically matched red blood cells

Responsibilities of Transfusion Medicine Service staff

- Where possible, ensure full red blood cell phenotype (Rh, Kell, Duffy, Kidd, MNS) is performed prior to the first transfusion in a patient who will require ongoing transfusion support (refer to section 9.8 for list of antigens)
- If the Transfusion Medicine Service does not have the capacity to perform these investigations, send samples to a regional reference laboratory or CBS requesting a full phenotype determination
- Record results of phenotype determinations in the patient record
- Provide phenotype compatible blood as determined by the Medical Director, Transfusion Medicine and appropriate clinical staff for subsequent transfusions
- Check with CBS for availability of phenotype information

Patient Management

- Patients with inherited red blood cell membrane disorders should be transfused for the symptomatic relief of anemia
- Non-alloimmunized patients with sickle cell syndromes should receive blood that is of the same Rh (D, C, c, E, e) and Kell phenotype
- Sickle cell syndrome patients with detectable alloantibody should receive antigen negative blood and extended phenotype matched units when possible
- Red cell units for children with sickle cell syndromes undergoing exchange transfusion should be negative for HbS if possible, because the post-transfusion hemoglobin S level is often measured to monitor the effectiveness of the exchange

8.7 MANAGEMENT OF TRANSFUSION IN PEDIATRIC PATIENTS WITH AUTOIMMUNE HEMOLYTIC ANEMIA

Refer to section 9.6

REFERENCES

9.0 SPECIAL TRANSFUSION SITUATIONS

Some clinical situations may present particular challenges to hospital Transfusion Medicine Services, for which it is useful to have, in advance, defined policies, processes and procedures for dealing with these situations. These special situations include:

- Support of a patient with signed refusal of consent for transfusion
- Management of a patient requiring massive transfusion
- Management of a patient with auto-immune hemolytic anemia requiring transfusion
- Transfusion support of patients who are recipients of solid organ, bone marrow or stem cell transplant
- Transfusion support in sickle cell syndromes

9.1 SUPPORT OF A PATIENT WITH SIGNED REFUSAL OF CONSENT FOR TRANSFUSION

### Policy

The Medical Director, Transfusion Medicine and appropriate medical/surgical staff jointly establish programs to support patients who ordinarily would require transfusion, but have refused consent for transfusion of blood components or products. Where hospital resources cannot adequately support such patients, a procedure should be established for referral to a facility where the necessary resources are available.

### Reason

Pre-planned support for patients who refuse transfusion is necessary for safety of the patient.

### Applies to

Patients who have refused transfusion.

### Responsibilities of the Medical Director, Transfusion Medicine

- Work with clinical staff to develop policies, processes and procedures to support patients who have refused consent to transfusion
- Ensure that any blood salvage techniques and equipment used to support such patients meet the standards (CAN/CSA) for collection, labeling, storage, reinfusion and staff training
- Work with surgical and anesthetic staff to assess the perioperative risks of morbidity and mortality of any elective procedure in a patient who refuses transfusion
- In cases with prohibitive risk, ensure that the surgical and anesthetic staff are fully aware of the level of risk, and have advised the patient accordingly
- Provide support/consultation to physicians caring for non-surgical, anemic or bleeding medical patients who refuse transfusion
- Ensure a mechanism is in place to document discussion of risks and options

### Responsibilities of Transfusion Medicine Service staff

- Record refusal of consent in the Transfusion Medicine Service patient record
- Notify the Medical Director, Transfusion Medicine (or delegate) if an order is received that is not consistent with advance directive

### Responsibilities of Treating Medical Staff

- Work with the Medical Director, Transfusion Medicine to:
  - Develop programs to support patients who have refused transfusion
  - Assess the perioperative risks of morbidity and mortality of any proposed elective surgical procedure in a patient who has refused transfusion
- The role of these physicians is to:
  - Advise the patient if prohibitive risk exists
  - Assist in the application of available blood alternatives
Patient Management

Alternatives to blood component and product transfusion include:

- Minimization of iatrogenic blood loss (e.g. limit laboratory testing, use of low volume collection containers)
- Meticulous surgical technique
- Maintenance of circulating volume with crystalloid or colloid
- Where acceptable to the patient:
  » Pre-surgical autologous blood donation (through CBS or hospital based autologous collection program)
  » Intraoperative cell salvage procedures
- Preoperative optimization of hemoglobin level:
  » Iron, folate, vitamin B12, erythropoetin
- Pharmacological agents that minimize bleeding
  » DDAVP, antifibrinolytic agents, vitamin K
- Anesthetic techniques to reduce blood loss (regional anesthesia)

REFERENCES

9.2 MANAGEMENT OF PATIENT REQUIRING MASSIVE TRANSFUSION

“Massive transfusion” is generally defined as requiring transfusion sufficient to replace one full circulating volume in less than 24 hours, or, in an adult, transfusion of 10 units or more in less than 24 hours.

Policy
The Transfusion Medicine Service has established guidelines for the management of patients requiring massive transfusion, including the administration of blood components and products and selection of red blood cells.

Reason
Patients receiving massive transfusion are at risk for developing coagulopathies that increase blood loss and contribute to morbidity and mortality. Such patients may also deplete the Transfusion Medicine Service of specific components, requiring changes to be made in blood group of components provided or incompatible blood given to patients with alloantibodies.

Applies to
Patients with severe blood loss requiring large volume, rapid transfusion, replacing at least one total blood volume in less than 24 hours.

Responsibilities of the Medical Director, Transfusion Medicine
• Work with clinical staff to establish a massive hemorrhage protocol to guide the general conduct of massive transfusion events and periodically test the protocol through simulation exercises
• Ensure that the equipment for blood warming and cell salvage, and the training and continuing assessment of competency of staff operating the equipment, meet the required standards (CAN/CSA)
• Establish the requirements for appropriate laboratory monitoring
• Be informed of any patients requiring massive transfusion
• Be available to treating medical staff, to consult as required on transfusion measures in individual cases

Responsibilities of Transfusion Medicine Service staff
• Follow associated technical procedures
• Consult with the Medical Director, Transfusion Medicine (or delegate) as indicated in procedures or by circumstances

Patient Management
• Clinical transfusion decisions must often be made before Transfusion Medicine Service examinations have been completed.
• However, these examinations should be completed as promptly and frequently as required by the clinical circumstances
• In general, the bleeding patient should be transfused to maintain the following parameters:
  » Platelet count >50x10^9/L (with head injury >100x10^9/L)
  » INR < 1.8
  » aPTT < 1.5 x normal
  » Fibrinogen >1.5g/L
  » Hemoglobin > 80g/L
• Application of blood conservation strategies
  » Antifibrinolics
  » Cell salvage
  » Prompt surgical intervention
  » Uterotonic agents in obstetrical hemorrhage
  » Interventional radiology
  » Avoidance of hypothermia and acidosis
• In setting of massive uncontrolled hemorrhage, component therapy should be administered according to the agreed protocol (see above)

RESOURCES
9.3 SWITCHING ABO GROUP IN MASSIVE TRANSFUSION OR DURING INVENTORY SHORTAGE

- Selection order of ABO compatible donor red blood cells is shown in table 9.1
- Selection order of ABO group of platelets or frozen plasma is shown in table 9.2
- It is not necessary to provide group specific cryoprecipitate because of the low volume of plasma (<10mls) in each unit. Non-group specific cryo is satisfactory for all blood groups. Pooling a mixture of blood groups together in one dose is not advised
- Urgent platelet transfusion should not be delayed in the event plasma compatible platelet units are not immediately available

Table 9.1. Selection Order of ABO Compatible Donor Red Blood Cells

9.4 SWITCHING FROM RHD NEGATIVE TO RHD POSITIVE RED BLOOD CELLS IN MASSIVE TRANSFUSION

It may not be possible to provide RhD negative blood for an RhD negative patient with massive transfusion. The following policies should be implemented for switching from RhD negative to RhD positive red blood cells:

- Prior to switching, if possible, confirm that the patient’s plasma does not contain anti-D
- If a continuing transfusion requirement is expected to exceed the available supply of RhD negative blood, or if the patient is likely to require >4-8 units of red blood cells, the switch to RhD positive blood should be made early to conserve RhD negative stock for other recipients
- In general, patients expected to receive <4 units of packed cells in a single transfusion episode should not be switched unless RhD negative stocks are critically low
- RhD negative females of child bearing potential should only be switched to RhD positive blood under extraordinary circumstances. RhIG is not recommended when RhD positive red blood cells are given intentionally
- If RhD positive platelets must be transfused to an RhD negative female of child bearing potential, post-transfusion treatment with RhIG is recommended

References:
9.5 MASSIVE TRANSFUSION IN A PATIENT WITH ALLOANTIBODIES

- Provision of antigen negative units to patients with alloantibodies may not be possible during massive transfusion due to the volume of blood required.
- If antigen positive units were transfused during active bleeding, subsequent transfusion should be with antigen negative units wherever possible.
- The Medical Director, Transfusion Medicine (or delegate) must advise the treating physicians that incompatible units were transfused, advise of the risk of a delayed hemolytic transfusion reaction, and recommend the appropriate laboratory parameters to be monitored.

REFERENCES

9.6 TRANSFUSION MANAGEMENT OF AUTOIMMUNE HEMOLYTIC ANEMIA (AIHA)

<table>
<thead>
<tr>
<th>Policy</th>
<th>The Transfusion Medicine Service has established policies and guidelines to assist in the management of patients with AIHA.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason</td>
<td>Patients with auto-antibodies requiring transfusion may pose difficulties with compatibility testing, and may be at risk for hemolytic transfusion reactions and/or developing alloantibodies. The Transfusion Medicine Service may be asked to determine whether the autoantibody exhibits blood group antigen specificity or, in the presence of cold autoantibodies, whether it shows a clinically significant thermal amplitude and titre.</td>
</tr>
</tbody>
</table>
| Responsibilities of the Medical Director, Transfusion Medicine | Be aware of such patients and oversee the laboratory investigations, and provide guidance to Transfusion Medicine Service Staff, and consultative advice to attending physicians. Advise treating physicians of the likely duration of delay in obtaining compatible blood, and where appropriate discuss possible transfer of the patient to specialized centre with the necessary range of pre-transfusion testing ability. Establish the policies, processes and procedures for release of incompatible blood in medical emergencies when complete pre-transfusion testing is not possible.  

Note: the term “least incompatible” should never be used as there is no clinical evidence to support that the survival of transfused red blood cells can be predicted based on the strength of a serological reaction. |
| Responsibilities of Transfusion Medicine Service staff | Perform appropriate technical procedures. Expedite investigations to obtain compatible blood as promptly as possible, or to exclude the possibility of underlying alloantibodies when compatible blood cannot be obtained. Consult with the technical supervisor and/or the Medical Director, Transfusion Medicine (or delegate) as indicated in technical procedures, or as necessary based on the technologist’s skills and experience, additional clinical information or results of laboratory examination. Be prepared to send appropriate blood samples to a reference centre or Canadian Blood Services for investigation when testing is beyond the scope of the hospital laboratory. |
### Pre-transfusion examination

- Preliminary antibody investigation to determine whether the autoantibody exhibits any blood group antigen specificity
- Examinations to determine whether there are any underlying alloantibodies, using additional technical devices such as autoadsorption, differential alloadsorption, pre-warming methods
- So far as technically possible, determine the patient’s red blood cell phenotype for clinically significant antigens using a pre-transfusion sample, or when not available by genotyping

### Phenotype specificity

So far as possible, red blood cells provided for transfusion should not express clinically significant antigens which the patient lacks (at minimum, red blood cells should be matched for Rh and Kell antigens).

### Patient management

- In a patient in stable condition, hemoglobin levels as low as 60 g/L may be tolerated, to try to avoid exposing the patient to transfusion and possible alloantibody development
- In a symptomatic patient, blood transfusion should not be withheld even if the pre-transfusion investigation has not been completed
- Patients failing to respond to RBC transfusion with an adequate post-transfusion rise in Hb or who show evidence of hemolysis post-transfusion should be investigated for incompatibility
- Patients must be monitored closely for signs and symptoms of acute hemolysis and for response to each unit with a Hb estimation
- If autoantibody demonstrating ‘e’ like specificity and patient is E negative, blood selected for transfusion should be E negative rather than e negative

2. AABB, 2017.
## 9.7 TRANSFUSION SUPPORT FOR PATIENTS FOLLOWING SOLID ORGAN OR ALLOGENEIC BONE MARROW OR STEM CELL TRANSPLANT

| **Policy** | The Transfusion Medicine Service in Centres performing transplant procedures shall have policies, processes and procedures to address the special needs of transplant patients for blood transfusion.  
In hospitals that are not transplant centres, the Transfusion Medicine Service providing post-transplant care will be guided by the transfusion policies and practices of the Transplant Centre where the transplant procedure was carried out. |
| --- | --- |
| **Reason** | Recipients of non-identical ABO/Rh organs or stem cells may demonstrate blood typing anomalies and may be at risk for hemolytic events.  
Transplant patients may be discharged to their community prior to complete recovery. Transfusion policies may not be identical for all transplant centres. |
| **Responsibilities of the Medical Director, Transfusion Medicine** | **Transplant Centre:**
- Establish policies, processes and procedures to address the particular problems of post-transplant blood transfusion practice in patients receiving non-identical ABO/Rh group organs/stem cells
- When such patients are discharged to the community, establish a mechanism to ensure that the Transfusion Medicine Service and the treating physician in that community are informed as to how the patient’s particular transfusion requirements should be met
- Patients should be informed in writing of their transfusion requirements
**Receiving hospital:**
- Be aware of post-transplant patients and their particular needs as communicated by the transplant centre staff
- Liaise with the treating physician to accommodate the patient’s particular requirements
- Inform Transfusion Medicine Service staff of the patient’s particular requirements and ensure they are entered in the patient’s Transfusion Medicine Service record |
| **Responsibilities of Transfusion Medicine Service staff** | • Follow associated technical procedures
• Check the patient record for specific instructions regarding irradiation and blood group requirements
• Consult with the Medical Director, Transfusion Medicine (or delegate) as indicated by procedures or circumstances |

## 9.8 TRANSFUSION SUPPORT OF PATIENTS WITH SICKLE CELL SYNDROMES

<table>
<thead>
<tr>
<th>Policy</th>
<th>The Medical Director, Transfusion Medicine and appropriate medical/surgical staff jointly establish policies, processes and procedures for the management of patients with sickle cell syndromes requiring blood transfusion.</th>
</tr>
</thead>
</table>
| Reason | Patients with sickle cell syndromes (homozygous sickle cell disease, hemoglobin S/C disease, hemoglobin S/beta-thalassemia) have particular transfusion requirements because of:  
- Increased blood viscosity due to presence of high concentrations of HbS  
- Increased liability to allo-immunization and risk of hemolytic transfusion reactions as a result of frequent red blood cell transfusion and genetic differences between sickle cell patients and the general blood donor pool |
| Responsibilities of the Medical Director, Transfusion Medicine | - Ensure that patients with sickle cell syndromes are so identified in the Transfusion Medicine Service records  
- Ensure that information on the patient’s extended red blood cell phenotyping test results are recorded in the Transfusion Medicine Service records  
- This information may be obtained:  
  » By referring appropriate samples to a reference laboratory or CBS  
  » By contacting Central Ontario CBS Registry of patients with sickle cell syndromes. (Central Ontario only 416-313-4675)  
- Establish policies, processes and procedures to optimize the extended phenotypic matching of donor red blood cells to patients requiring transfusion  
- Establish guidelines for red blood cell transfusion in sickle-cell patients because of significant differences in transfusion indications in different clinical situations in this patient population  
- Where appropriate, consult with an expert in transfusion medicine in cases presenting challenges in clinical decision-making regarding transfusion support  
- Consult with the treating physician regarding the provision of suitable donor red blood cells in a clinically appropriate time frame  
- Ensure that any equipment used for exchange transfusion and the competency of staff operating the equipment meets Canadian Standards Association requirements (CAN/CSA) |
| Responsibilities of Transfusion Medicine Service staff | - Follow policies and procedures as written  
- Notify the Medical Director, Transfusion Medicine when informed of a request for red blood cells for transfusion, or otherwise, of the presence of a sickle cell syndrome patient in the hospital if unable to obtain appropriate red blood cells and/or order is outside of sickle cell transfusion guidelines |
| Responsibilities of the treating physician | - To work with the Medical Director, Transfusion Medicine to arrange the optimal red blood cell transfusion regime in a clinically timely fashion. This may involve:  
  » Simple red blood cell transfusion  
  » Exchange transfusion of red blood cells  
  » Transfer to a centre experienced in management of transfusion in patients with sickle cell syndromes |
9.0 SPECIAL TRANSFUSION SITUATIONS

Special considerations

- In the absence of symptoms (e.g. heart failure, dyspnea, hypotension, severe fatigue) transfusion should be avoided unless the hemoglobin level is decreased to <50 g/L in the setting of uncomplicated vaso-occlusive crisis
- In the treatment or prevention of sickle cell complications the hemoglobin level should never be increased above 100 g/L
- Improvement in tissue oxygen delivery is better achieved through decreasing the HbS percentage than simply by raising the hemoglobin concentration
- Blood matched for extended blood group phenotype is desirable to reduce allo-immunization in individuals liable to require frequent transfusion
  - Non-immunized, Rh/Kell only
  - Allo-immunized, extended (Rh, Kell, Duffy, Kidd, MNS)
- Sickledex® positive red blood cells should not be used for exchange transfusion if possible, as this complicates calculation of its effectiveness
- For recommendations in particular cases, the literature or a medical centre specializing in care of sickle cell syndromes should be consulted

## 10.0 DISASTER AND CONTINGENCY PLANS

<table>
<thead>
<tr>
<th>Policy</th>
<th>The Transfusion Medicine Service has written plans for internal and external disasters and for contingency situations occasioned by blood shortages. These plans are stored centrally, updated as required and include up-to-date contact information.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason</td>
<td>The Transfusion Medicine Service is a vital function in the case of internal or external disasters and critical blood shortages. The CSTM and CSA Standards require the establishment of a Disaster Plan and a Contingency Plan for blood shortages in respect of Transfusion Medicine Services consistent with suppliers’ contingency plans and health authority requirements. The Ontario Ministry of Health and Long Term Care requires all health care facilities within Ontario to establish a hospital based contingency plan for the management of blood shortages in alignment with the Ontario Provincial Contingency Plan for the Management of Blood Shortages as well as the National Plan for the Management of Shortages of Labile Blood Components.</td>
</tr>
<tr>
<td>Applies to</td>
<td>External and internal disasters and critical blood shortages as defined by the Ontario Ministry of Health and Long Term Care: Contingency Planning for Blood Shortages and the National Advisory Committee on Blood and Blood Products: National plan for the management of shortages of labile blood components.</td>
</tr>
</tbody>
</table>
| Responsibilities of the Medical Director, Transfusion Medicine | • Cooperate with other departments or organizations to develop plans appropriate to the level and nature of services provided by the Transfusion Medicine Service  
• Ensure that the hospital is aware of and includes the Transfusion Medicine Service in its own disaster plans  
• Ensure that the hospital meets the provisions of the National and Provincial Contingency Plans for Management of Blood Shortages including the establishment of a hospital based plan and a Hospital Emergency Blood Management Committee (HEMBC).  
• Cooperate with other departments and/or other organizations to plan and execute mock exercises to ensure the Transfusion Medicine Service can respond appropriately in case of a disaster or critical blood shortage. |
| Responsibilities of Transfusion Medicine Supervisor | • Review the plans annually, and update contact information as required  
• Ensure staff are trained appropriately to respond to a disaster or notification of a blood shortage  
• Update inventory levels as appropriate for hospital activities |
| Responsibilities of Transfusion Medicine Service staff | • Be familiar with and follow the provisions of the plan when it is implemented  
• Participate in disaster and critical blood product shortage contingency exercises  
• Cooperate with other departments and/or organizations as needed in disaster or critical blood product shortage situations |
| Scope of Disaster Plan | • The following basic information is included in the plan:  
  » Communication with hospital and regional disaster teams  
  » Communication with other hospital transfusion medicine services  
  » Communication with CBS  
  » Communication with patients and hospital staff  
  » Call list for all staff  
  » Roles and responsibilities of staff.  
  » Management of current inventory if applicable (e.g. moving to safe and accessible storage)  
  » Ability to obtain and store new inventory from suppliers or other centres  
  » Optimal use of limited inventory |
- Where the disaster involves a large number of local casualties, provision for the following is also included in the plan:
  » Triage of limited inventory
  » Recipient identification and examination
  » Specific group O RhD negative requirements
  » Staffing of the Transfusion Medicine Service
  » Computer downtime processes

### Scope of the Contingency Plan for Management of Blood Product Shortages

<table>
<thead>
<tr>
<th>Types of Shortages (as defined by CBS inventory levels):</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Green” phase (optimal) &gt;3-4 days of average daily use</td>
</tr>
<tr>
<td>“Green Advisory” phase (minimal decrease) more than 3 successive days of &lt; 2-3 days of average daily use of selected red cell groups</td>
</tr>
<tr>
<td>“Amber” phase (serious) 2-3 days of average daily use</td>
</tr>
<tr>
<td>“Red” phase (critical) &lt; 2 days of average daily use</td>
</tr>
<tr>
<td>“Recovery” phase – gradual resumption of normal transfusion activity in keeping with increasing inventory levels</td>
</tr>
</tbody>
</table>

- Preparedness for responding to blood shortages
  » Develop hospital contingency plan for shortages
  » Define inventory levels by blood shortage phase and reduce target levels to reduce amount of blood requested from CBS
  » Identify blood conservation opportunities
  » Identify surgeries with high blood loss that require to be postponed
  » Define stepwise reduction of blood use to occur on activation of plan
  » Identify key stakeholders to be identified on activation of the plan
  » Develop communication protocol to be used for notification
  » Ensure plan for managing blood shortages is integrated into the Disaster Plan and/or hospital wide pandemic plan
  » Provide training on the contents of the plan and communication measures related to blood shortages
  » Prepare detailed procedures to be followed should an “Amber” or “Red” phase shortage level be identified
  » For details of desirable measures, consult the Ontario Contingency Plan for Management of Blood Product Shortages and the National Advisory Committee on Blood and Blood Products Plan for the Management of Shortages of Labile Blood Components (see references below)

- Establishment of an Emergency Blood Management Committee (EBMC)
  » Each hospital should establish an Emergency Blood Management Committee to decide on strategies and measures to be implemented when the hospital is notified of impending shortages
  » Committee may include Medical Director, Transfusion Medicine, Manager responsible for the Transfusion Service, an anesthetist, surgeon, hematologist/oncologist, ER staff physician, chair of the Transfusion Committee, Transfusion Nursing Specialist, Risk Manager and other members deemed appropriate
  » For “Red phase” alerts, the EBMC may be expanded to include senior hospital management and senior medical and nursing staff
  » Principal features of the terms of reference for an EBMC are outlined in the Ontario Contingency Plan and Toolkit
  » One of the important duties of the EBMC will be the triage of blood order requests to optimize use of available inventory to meet the most urgent needs. Identification of a triage officer/team to perform triage of blood order requests is required in “red” phase shortages

11.0 TRANSFUSION REACTIONS

<table>
<thead>
<tr>
<th>Policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Transfusion Medicine Service has established policies, processes and procedures for the identification, investigation and management of suspected transfusion reactions. All transfusion reactions should be reported according to Health Canada requirements. All transfusion reactions should also be reported to the national surveillance programs to which the hospital is a reporting participant.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>While the care of the recipient is primarily the responsibility of the attending physician(s), some immediate and delayed transfusion reactions are sufficiently uncommon that physicians and nurses may be unfamiliar with their recognition and management. Thus, the Medical Director, Transfusion Medicine has an important role in the education of clinical staff in the diagnosis and management of transfusion reactions. Transfusion safety, transfusion practice and accreditation standards all require that facilities detect, manage, investigate and report such reactions.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Applies to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recipients with suspected adverse reactions to blood components or products.</td>
</tr>
</tbody>
</table>

The Public Health Agency of Canada (PHAC) defines an adverse reaction as:

*An undesirable and unintended occurrence during or after the administration of blood, blood components, or blood products (plasma derivatives) whether or not considered to be related to the administration of these products.*

<table>
<thead>
<tr>
<th>Responsibilities of the Medical Director, Transfusion Medicine</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Liaise with, communicate with, and promote the education of, clinical staff regarding the recognition, management, investigation and reporting of transfusion reactions</td>
</tr>
<tr>
<td>• Determine the extent of investigation required on possible adverse reactions as defined above</td>
</tr>
<tr>
<td>• Provide direction as necessary to technologists regarding the examinations to be performed</td>
</tr>
<tr>
<td>• Report the final conclusion regarding the type of reaction in a timely manner</td>
</tr>
<tr>
<td>• Sign off on all required documentation</td>
</tr>
<tr>
<td>• Review the clinical and laboratory information on all transfusion reactions, assess the probability of a causal relationship between transfusion and the signs and symptoms, and if applicable categorize the reaction according to PHAC definitions (see users manual at PHAC website)</td>
</tr>
<tr>
<td>• Advise the treating physician, when appropriate, on the investigations, possible management and strategies to avoid future adverse reactions</td>
</tr>
<tr>
<td>• Ensure that CBS or the plasma protein product manufacturer is immediately informed in cases where a component/product-attribute issue (e.g. bacterial contamination) is linked to a transfusion and another recipient may be at risk</td>
</tr>
<tr>
<td>• Ensure that CBS or the plasma protein product manufacturer is contacted promptly, and in any case within 24 hours, if a death is linked to transfusion</td>
</tr>
<tr>
<td>• Report the result of assessment of the putative adverse reaction to the required surveillance programs. There are currently two national surveillance programs: The Transfusion Transmitted Injury Surveillance System (TTISS) and the Transfusion Error Surveillance System (TESS). Not all hospitals report through these systems. Contact PHAC for more information if your hospital does not currently report to these systems and would like to do so</td>
</tr>
<tr>
<td>• Engage clinical staff in the development of clinical practice documents for reporting transfusion reactions</td>
</tr>
</tbody>
</table>
### Responsibilities of clinical staff
- Recognize and manage the signs and symptoms of a transfusion reaction
- Confirm all unique identifiers for recipient and component/product to determine whether the transfused component/product was intended for the recipient
- Complete a transfusion reaction report form and submit to the Transfusion Medicine Service
- With any signs and symptoms for which the transfusion is to be terminated (i.e. other than urticaria/pruritis or mild non-hemolytic febrile reaction controlled with antipyretics) including IVIG-related reactions not resolved by ongoing transfusion care, send the following to the Transfusion Medicine Service:
  - The blood component/product with the remaining contents, sealed to avoid contamination
  - The attached administration set
  - Recipient post-reaction blood samples or a request for their collection
  - Recipient blood culture samples or request for their collection, if indicated by the nature of the reaction
  - Epinephrine should be readily available wherever transfusion is carried out (see also section 11.1)
  - First post-transfusion voided urine sample
- Collaborate with laboratory staff in the development of clinical practice documents for reporting transfusion reactions

### Responsibilities of Transfusion Medicine Service staff
- Based on the clinical information provided, complete an investigation in accordance with the policies, processes and procedures, and the guidelines laid out in sections 11.8 below
- Send copies of completed transfusion reaction investigations to the required surveillance agencies (TTISS/TESS; CBS, Plasma protein product manufacturers)
- At the request of the Medical Director, participate in the development of clinical practice and laboratory documents for the investigation and reporting of transfusion reactions. With Health Canada regulations, hospitals are required to report any reaction to a component where the hospital has modified it (washed, plasma reduced etc).
### General Policies

#### Clinical and Laboratory Teams

Every effort should be made to create and maintain a transfusion leadership team with clinical, technical and transfusion medicine physician representation that coordinates information in regard to transfusion practice and develops detailed documents that inform all staff involved in transfusion care on standardized optimal practice.

#### Immediate contact –
clinical staff with the Transfusion Medicine Service

The nursing staff in the clinical area will immediately contact the Transfusion Medicine Service to report reactions when:

- A recipient identity check error is found in relation to a transfused recipient or
- A transfused recipient shows any of the following:
  - Sudden spike in fever >1.5°C from pre-transfusion temp
  - Sudden onset of hypoxemia/dyspnea
  - Sudden onset of hypotension
  - New onset of red/brown urine

#### Immediate contact –
Transfusion Medicine Service staff with Medical Director, Transfusion Medicine (or delegate):

The Transfusion Medicine Service staff will immediately contact the Medical Director, Transfusion Medicine or delegate if they receive a report of a transfusion reaction with the following:

- Recipient or component/product identity check error
- Suspected bacterial contamination of the component/product
- Sudden onset of hypoxemia/dyspnea
- Sudden onset of hypotension
- Hemoglobinuria reported in recipient’s post-transfusion urine sample
- If and when, the transfusion reaction investigation shows:
  - Abnormal results after completion of the primary investigation
  - Component/product is requested before the investigation is completed

#### Premedication of recipient

- Premedication of recipients with anti-histamines or anti-pyretics is NOT recommended in the absence of a history of repeated allergic or febrile reactions
- “Fever” is defined as a temperature ≥ 38°C AND an increase of ≥ 1°C above recipient’s baseline temperature (oral temperature)

#### Restarting transfusions

<table>
<thead>
<tr>
<th>Signs &amp; Symptoms</th>
<th>Ongoing transfusion care</th>
</tr>
</thead>
</table>
| Urticaria/pruritis with any component/product:  
  - Minor allergic reaction.
  - Absence of clerical error, anaphylaxis, serious symptoms.
  Medical assessment indicates transfusion may proceed.  
| Close monitoring of vital signs |
| Fever  
  » Temperature <39°C or fever is a consequence of an underlying condition.  
  » Absence of clerical error, serious symptoms.  
  » Medical assessment indicates transfusion may proceed.  
| Close monitoring of vital signs |

#### Use of surveillance data

- Track changes in reaction patterns for the institution and assess reactions in the wider hospital population for comparison
- Provide information for the institution’s Transfusion Committee to facilitate:
  » Identification of opportunities for improvement in clinical or laboratory transfusion practice
  » Initiation of process improvement projects
### 11.0 TRANSFUSION REACTIONS

**Recipient assessment and monitoring**

The recipient is directly observed during initiation of the transfusion, and for the first 15 minutes of the transfusion. Vital signs are recorded as indicated below.

<table>
<thead>
<tr>
<th>Recipient category</th>
<th>Frequency of Vitals/Observation</th>
<th>Vital signs include</th>
</tr>
</thead>
</table>
| ALL                | • Vital signs within 30 minutes prior to transfusion  
|                    | • Observe for first 15 minutes, starting the transfusion slowly if clinical circumstances permit  
|                    | • Vital signs 15 minutes after start of transfusion  
|                    | • Vital signs at end of transfusion of each unit  
|                    | • Vital signs and observation if a transfusion reaction is suspected |
| High Risk: Those with risk of cardiac overload, history of previous transfusion reaction, or clinically unstable recipients | • All of the above plus:  
|                    | » Oxygen saturation  
|                    | » Auscultation for recipients at risk for circulatory overload (TACO), e.g. elderly, pediatric, cardiac disease  
|                    | • More frequent monitoring and observation as prescribed by the ordering physician |
| Unconscious        | • Continuous monitoring |

**Laboratory investigation of suspected transfusion reactions**

- Laboratory investigation of transfusion reactions will depend on the type of reaction and the differential diagnostic possibilities
- All laboratories should have an algorithm and process for determining the investigation that is required

**Retention of records of transfusion reactions**

- 10 years for recipients who have had serious transfusion complications or reactions
- Minimum of 5 years for all other recipients with transfusion reactions

**Reporting of reactions to external agencies**

- All serious transfusion reactions must be reported within 24 hours to:  
  » Fresh blood and blood components: CBS  
  » Manufactured blood products: report to the individual manufacturer  
  » It is the manufacturer’s responsibility to report all serious adverse reactions to Health Canada within 24 hours  
- Preliminary report with full investigation to follow and complete report within 15 days. If fatality report must be complete within 24 hours

<th>A single to widespread urticarial lesions</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>May be associated with pruritus, erythema, mild upper respiratory symptoms, nausea, diarrhea</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Management</th>
<th>Interrupt the transfusion</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Give diphenhydramine 25-50 mg po or IV depending on severity of the reaction</td>
</tr>
<tr>
<td></td>
<td>Transfusion may be restarted slowly if the urticarial rash involves less than 2/3 of body surface and no associated symptoms suggesting severe allergic reaction</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Prevention</th>
<th>For recurrent urticarial reactions, the following measures (of uncertain efficacy) may be used:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Premedication with diphenhydramine and/or corticosteroids</td>
</tr>
<tr>
<td></td>
<td>Plasma depletion of red blood cells or platelets</td>
</tr>
<tr>
<td></td>
<td>Washing red blood cells or platelets (see section 6.9)</td>
</tr>
</tbody>
</table>

#### Severe Allergic Reaction/Anaphylaxis

<table>
<thead>
<tr>
<th>Clinical features</th>
<th>Usually unexplained</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Sensitivity to IgA or haptoglobin in a patient with deficiency of these</td>
</tr>
<tr>
<td></td>
<td>Sensitivity to polymorphic forms of plasma proteins</td>
</tr>
<tr>
<td></td>
<td>Sensitivity to allergens or drugs in donor plasma</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Management</th>
<th>Stop the transfusion. Do not restart</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Severe allergic reaction – urticaria &gt;2/3 of body area</td>
</tr>
<tr>
<td></td>
<td>Anaphylaxis</td>
</tr>
<tr>
<td></td>
<td>Promptly administer epinephrine, corticosteroids, diphenhydramine, vasopressors and supportive care as required</td>
</tr>
<tr>
<td></td>
<td>Ventilatory support as required</td>
</tr>
<tr>
<td></td>
<td>Epinephrine should be readily available wherever transfusion is carried out</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Prevention</th>
<th>Premedication with intravenous steroids and diphenhydramine</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Determine IgA status of the patient</td>
</tr>
<tr>
<td></td>
<td>Test for anti-IgA regardless of status</td>
</tr>
<tr>
<td></td>
<td>Where the patient is IgA deficient with anti IgA the following products may be recommended:</td>
</tr>
<tr>
<td></td>
<td>IgA deficient components available from CBS</td>
</tr>
<tr>
<td></td>
<td>Washed red blood cells or platelets (see section 6.9)</td>
</tr>
<tr>
<td></td>
<td>If patient is of Asian extraction, test for haptoglobin deficiency</td>
</tr>
</tbody>
</table>
### Table 11.3 Management Algorithm for Allergic Reactions

<table>
<thead>
<tr>
<th><strong>Allergic Reaction</strong></th>
<th>A transfusion reaction that may be associated with urticaria, facial edema, airway edema, lower respiratory tract symptoms, hypotension, or shock</th>
</tr>
</thead>
</table>
| **Immediate Management** | 1. **Interrupt the transfusion** & maintain IV access with 0.9% saline  
2. Take the patient’s vital signs  
3. Re-check name of patient & name on blood product  
4. Physician assessment required  
5. Notify hospital transfusion service (blood bank) even if transfusion restarted or already completed |
| **Clerical error, anaphylaxis or serious symptoms?** | 1. Hypotension  
2. Dyspnea/cough  
3. Tachycardia  
4. Generalized flushing or anxiety  
5. Nausea/vomiting  
6. Widespread rash > 2/3 body |

<table>
<thead>
<tr>
<th><strong>No</strong></th>
<th><strong>Yes</strong></th>
</tr>
</thead>
</table>
| Consistent with minor allergic reaction | **DO NOT RESTART TRANSFUSION**  
• Notify the patient’s physician **STAT**  
• Notify the hospital transfusion service (blood bank) immediately |
| Give diphenhydramine 25-50 mg IV/po | **SUSPECT ANAPHYLACTIC REACTION OR SEVERE ALLERGIC REACTION** |
| Continue transfusion cautiously | Stop transfusion if patient develops any of the above symptoms |

### REFERENCES

### 11.2 DYSPNEA

<table>
<thead>
<tr>
<th>Transfusion-related acute lung injury (TRALI)</th>
<th>Etiology</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Two mechanisms have been postulated:</td>
</tr>
<tr>
<td></td>
<td>• Passive transfer of HLA or granulocyte antibodies to recipient from a donor sensitized by previous pregnancy or transfusion</td>
</tr>
<tr>
<td></td>
<td>• Biologic response modifiers in the transfused component with a susceptible recipient</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Clinical features</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Acute onset of dyspnea during or within 6 hours of transfusion.</td>
</tr>
<tr>
<td>• Hypoxemia</td>
</tr>
<tr>
<td>• Bilateral lung infiltrates on radiograph</td>
</tr>
<tr>
<td>• No evidence of circulatory overload (see 11.3)</td>
</tr>
<tr>
<td>• Predisposing factors include direct lung injury (e.g. aspiration, pneumonia, toxic inhalation) and indirect lung injury (e.g. severe sepsis, multiple trauma, burn injury)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Investigation</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Accurate diagnosis and reporting to the hospital Transfusion Medicine Service is essential to identifying implicated donors</td>
</tr>
<tr>
<td>• Patient and donor testing for implicated antigens/antibodies should be arranged through CBS</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Stop the transfusion and check vital signs</td>
</tr>
<tr>
<td>• Check identification of patient and component label</td>
</tr>
<tr>
<td>• Return residual component and clamped tubing to the Transfusion Service laboratory</td>
</tr>
<tr>
<td>• Supportive care, including mechanical ventilation as necessary</td>
</tr>
<tr>
<td>• Diuretics and steroids are not believed to be useful</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Prevention</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Deferral of donors confirmed to be implicated in an episode of TRALI</td>
</tr>
<tr>
<td>• Component strategies to reduce the risk of TRALI include:</td>
</tr>
<tr>
<td>» Plasma for transfusion from male donors only</td>
</tr>
<tr>
<td>» Buffy coat platelet pools re-suspended in male plasma</td>
</tr>
<tr>
<td>» Apheresis single donor platelets collected only from male and never pregnant females</td>
</tr>
</tbody>
</table>
### 11.0 TRANSFUSION REACTIONS

#### Table 11.4 Management Algorithm for Dyspnea

<table>
<thead>
<tr>
<th>Dyspnea</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Immediate Management:</strong></td>
</tr>
<tr>
<td>1. Stop transfusion &amp; maintain IV access with 0.9% saline</td>
</tr>
<tr>
<td>2. Take patient's vital signs</td>
</tr>
<tr>
<td>3. Re-check identification of patient &amp; blood product</td>
</tr>
<tr>
<td>4. Physician assessment required</td>
</tr>
<tr>
<td>5. Notify hospital transfusion service (blood bank)</td>
</tr>
<tr>
<td>6. Return clamped blood unit with tubing attached</td>
</tr>
</tbody>
</table>

**Consider:**
- TRANSFUSION-RELATED ACUTE LUNG INJURY (TRAL)
- TRANSFUSION-ASSOCIATED CIRCULATORY OVERLOAD (TACO)
- ANAPHYLAXIS
  - If TRAL is suspected, notify hospital transfusion service (blood bank) so that special donor and recipient testing can be performed
  - Order STAT chest X-ray
  - Oxygen, diuresis, and supportive care as required

---

### 11.3 TRANSFUSION-ASSOCIATED CIRCULATORY OVERLOAD (TACO)

<table>
<thead>
<tr>
<th>TACO</th>
<th>Etiology</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Impaired cardiac or renal function</td>
</tr>
<tr>
<td></td>
<td>• Excessively rapid rate of transfusion</td>
</tr>
<tr>
<td></td>
<td>• Elderly patients, infants and euvolemic severely anemic patients</td>
</tr>
<tr>
<td></td>
<td>• Common and under-diagnosed</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Clinical features</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Dyspnea and orthopnea</td>
</tr>
<tr>
<td></td>
<td>• Cyanosis</td>
</tr>
<tr>
<td></td>
<td>• Increased venous pressure</td>
</tr>
<tr>
<td></td>
<td>• Tachycardia, hypertension</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Investigation</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Cardiac assessment</td>
</tr>
<tr>
<td></td>
<td>• Chest X-ray</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Management</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Interrupt the transfusion</td>
</tr>
<tr>
<td></td>
<td>• Administer diuretics intravenously and oxygen as needed</td>
</tr>
<tr>
<td></td>
<td>• Consider restarting transfusion at reduced rate if clinical status allows and component is still within standard time limits</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Prevention</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Pre-transfusion assessment to identify patients at risk</td>
</tr>
<tr>
<td></td>
<td>• Measures at time of transfusion include:</td>
</tr>
<tr>
<td></td>
<td>» Transfuse only one unit at a time and over longer time period up to 3.5 hours from time of issue from Transfusion Medicine Service</td>
</tr>
<tr>
<td></td>
<td>» Pre-emptive diuretics</td>
</tr>
<tr>
<td></td>
<td>» Oral furosemide in low risk patients</td>
</tr>
<tr>
<td></td>
<td>» IV furosemide in high risk patients</td>
</tr>
<tr>
<td></td>
<td>» Transfuse components in smaller (“split”) aliquots</td>
</tr>
</tbody>
</table>

| Anaphylaxis          | See section 11.1                                                 |

### 11.4 HYPOTENSION (BRADYKININ MEDIATED)
Defined as a >30 mmHg fall in systolic or diastolic blood pressure (in adults only).

<table>
<thead>
<tr>
<th>Hypotension</th>
<th>Etiology</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- Genetic polymorphism leading to decrease in bradykinin degradation</td>
</tr>
<tr>
<td></td>
<td>- Use of angiotensin converting enzyme inhibitors</td>
</tr>
<tr>
<td></td>
<td>» Hypotension may be a part of the constellation of signs in other transfusion reactions, including acute hemolytic reactions, bacterial sepsis, severe febrile non-hemolytic transfusion reactions, TRALI or anaphylaxis</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Clinical features</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- Majority occur with platelet transfusions</td>
</tr>
<tr>
<td></td>
<td>- Often associated with use of ACE inhibitors</td>
</tr>
<tr>
<td></td>
<td>- Other symptoms may include nausea, vomiting, dyspnea and urticaria</td>
</tr>
<tr>
<td></td>
<td>- Rarely associated with significant morbidity</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Investigation</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- Consider other potential causes of hypotension listed above</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Management</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- Detect early, during the monitoring of transfusion in the first 15 minutes</td>
</tr>
<tr>
<td></td>
<td>- Stop the transfusion and do not restart</td>
</tr>
<tr>
<td></td>
<td>- Provide supportive care including IV fluids</td>
</tr>
<tr>
<td></td>
<td>- Consult with an expert in transfusion medicine if further transfusion is required</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Prevention</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- Where ACE inhibitors have been implicated, consider alternative anti-hypertensive agents</td>
</tr>
</tbody>
</table>
Table 11.5 Management Algorithm for Hypotension

**Hypotension**

>30 mmHg drop in systolic or diastolic blood pressure*

**Immediate Management:**
1. Stop the transfusion and maintain IV access
2. Take patient's vital signs
3. Re-check identification of patient & blood product
4. Consider differential diagnosis
5. Physician assessment required

**Consider:**
1. Acute hemolytic transfusion reaction
2. Bacterial sepsis
3. Severe febrile non-hemolytic transfusion reaction
4. Bradykinin mediated hypotension
5. Transfusion-related acute lung injury
6. Anaphylaxis

**No**
unrelated to transfusion

Possibly resume transfusion
after reassessing

**Yes**
unrelated to transfusion

Do not restart transfusion.
Refer to appropriate sections.

* Definition refers to adult patients only

11.5 CYTOPENIAS AFTER TRANSFUSION

<table>
<thead>
<tr>
<th>Post-transfusion purpura (PTP)</th>
<th>Etiology</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Transfusion of a platelet antigen positive component to a patient who lacks that antigen</td>
</tr>
<tr>
<td></td>
<td>75% of cases involve HPA-1a positive platelets transfused to an HPA-1a negative recipient</td>
</tr>
<tr>
<td></td>
<td>Autologous platelet destruction occurs but the mechanism is unclear</td>
</tr>
</tbody>
</table>

| Clinical features | Occurs 1-24 days (median 9 days) after transfusion |
|                  | Female:male ratio 5:1 as a consequence of sensitization in pregnancy |
|                  | Platelet count <10 x 10⁹/L in 80% of cases |
|                  | Mortality about 8%, mainly intra-cranial hemorrhage |
|                  | Thrombocytopenia lasts about 2 weeks if untreated with IVIG |

| Investigation | Test patient plasma for platelet-specific antibodies (refer to CBS) |

| Management | IVIG 1g/kg daily for 2 days; response expected within 4 days |
|           | Patients with PTP should be warned that they (and possibly relatives) are at risk for neonatal immune thrombocytopenia |

| Prevention | Transfuse only with components negative for the appropriate antigen |

REFERENCES

11.6 TRANSFUSION-ASSOCIATED GRAFT-VERSUS-HOST DISEASE (GVHD)

<table>
<thead>
<tr>
<th>GVHD</th>
<th>Etiology</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Due to an immune response mounted by donor lymphocytes against the recipient’s HLA determinants</td>
</tr>
<tr>
<td></td>
<td>Occurs in immuno-compromised recipients, and</td>
</tr>
<tr>
<td></td>
<td>Immuno-competent recipients receiving a haplo-identical product</td>
</tr>
</tbody>
</table>

| Clinical features | Fever, rash, hepatic dysfunction and diarrhea 1-2 weeks post-transfusion |
|                  | Overwhelming infections with mortality >90% |

| Investigation | Diagnosis can be confirmed by skin, liver or bone marrow biopsy |
|              | Confirmation requires documentation of presence of donor lymphocytes (HLA typing or DNA analysis) |

| Management | Treatment mostly ineffective |
|           | Survival is rare, and is attributed to immunosuppressive therapy |

| Prevention | For patients at risk, irradiation of cellular components (red blood cells and platelets) is critical |
|           | Pre-storage leukoreduction does not completely eliminate the risk of GvHD |
|           | Indications for irradiation are detailed in section 6.8 |
|           | Patient at risk should have a card indicating the requirement for irradiated cellular components |

REFERENCES
11.7 RARE CAUSES OF TRANSFUSION-ASSOCIATED CYTOPENIA

- Transfusion-associated alloimmune thrombocytopenia:
  - Due to platelet-specific donor antibodies to recipient platelet antigens
- Transfusion-associated alloimmune neutropenia:
  - Due to neutrophil-specific donor antibodies to recipient neutrophil antigens

11.8 HEMOLYSIS AFTER TRANSFUSION

<table>
<thead>
<tr>
<th>Delayed hemolytic transfusion reactions (DHTR)</th>
<th>Etiology</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Results from formation of antibodies in the recipient to red blood cell allo-antigens from transfusion or exposure during pregnancy</td>
</tr>
<tr>
<td></td>
<td>• Concentrations of antibody are below the level of detectability of antibody screen testing</td>
</tr>
<tr>
<td></td>
<td>• Incidence is about 1 in 7000 units of red blood cells transfused</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Clinical features</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Appear 3 – 14 days post-transfusion</td>
</tr>
<tr>
<td></td>
<td>• Fall in hemoglobin, spherocytosis, reticulocytosis, elevated bilirubin, hemoglobinuria, elevated LDH</td>
</tr>
<tr>
<td></td>
<td>• Positive DAT and antibody screen</td>
</tr>
<tr>
<td></td>
<td>• Most are relatively benign, but occasional DHTRs present with severe hemolysis and renal failure may occur</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Investigation</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Identification of the offending allo-antibody</td>
</tr>
<tr>
<td></td>
<td>• Confirmation of the presence of the corresponding antigen on one or more of donor red blood cell units transfused</td>
</tr>
<tr>
<td></td>
<td>• Confirmation of the absence of the corresponding antigen on the recipient’s red blood cells</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Management</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Supportive therapy as needed</td>
</tr>
<tr>
<td></td>
<td>• Select only red blood cells “negative” for the antigen involved for subsequent transfusions</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Prevention</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Avoid transfusion if possible</td>
</tr>
<tr>
<td></td>
<td>• Use antibody screening methods with maximal sensitivity</td>
</tr>
<tr>
<td></td>
<td>• Notify the patient and supply a wallet card and recommend medical alert bracelet with antibody information</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Other possible causes of hemolysis after transfusion</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• Transfusion-transmitted malaria or babesiosis</td>
<td></td>
</tr>
<tr>
<td>• Use of hypotonic IV solutions with red blood cell transfusion</td>
<td></td>
</tr>
<tr>
<td>• Medical device (warmer, cell saver) malfunction</td>
<td></td>
</tr>
<tr>
<td>• Freezing or overheating of red blood cells</td>
<td></td>
</tr>
<tr>
<td>• Transfusion of outdated red blood cells</td>
<td></td>
</tr>
<tr>
<td>• Transfusion through small bore needle under pressure</td>
<td></td>
</tr>
</tbody>
</table>

11.9 ADVERSE REACTIONS TO INTRAVENOUS IMMUNOGLOBULIN (IVIG)

**General policy**
- In the event of an adverse reaction, stop the transfusion and assess the patient
- If the reaction is minor, the transfusion may be continued at a reduced infusion rate
- Report all adverse reactions to the Transfusion Medicine Service

**Clinical features and management of reactions to IVIG**

### Table 11.6 Adverse Reactions to IVIG

<table>
<thead>
<tr>
<th>Reaction</th>
<th>Severity</th>
<th>Frequency**</th>
<th>Comment/Treatment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Anxiety, chills/fever, rash, flushing, headache, chest, back or abdominal pain, nausea/vomiting, tachycardia, hypoperfusion</td>
<td>Mild-moderate</td>
<td>Common</td>
<td>Slow or pause IVIG treatment. Symptomatic treatment. Recurrent reactions – pre-medicate and/or change to another manufacturer’s IVIG product</td>
</tr>
<tr>
<td>Aseptic meningitis</td>
<td>Moderate</td>
<td>7 in 10,000[^{272}]</td>
<td>Stop infusion. Administer analgesics. Usually resolves spontaneously in 24-48 hours</td>
</tr>
<tr>
<td>Anaphylaxis</td>
<td>Severe</td>
<td>Rare</td>
<td>Stop infusion. May require epinephrine promptly. Consider testing for IgA and anti-IgA (see page 63)</td>
</tr>
<tr>
<td>Acute renal failure</td>
<td>Severe</td>
<td>Rare</td>
<td>Usually with sucrose-containing product (none currently licensed in Canada). Predisposing factors: age &gt;65, diabetes mellitus, pre-existing renal insufficiency</td>
</tr>
<tr>
<td>Hemolysis</td>
<td>Mild-Severe</td>
<td>10[^{273,274}]</td>
<td>More common in non-group O patients</td>
</tr>
<tr>
<td>Thrombo-embolic events</td>
<td>Severe</td>
<td>0.5-1%[^{275}]</td>
<td>Causative relationship not clearly established. Possibly related to increases in viscosity</td>
</tr>
<tr>
<td>Infectious disease transmission</td>
<td>Severe</td>
<td>No reported case since HCV in 1995.[^{276}] No known case of transmission of HIV or HBV</td>
<td>Modern viral reduction measures are robust. Prion (vCJD) transmission remains an entirely theoretical risk</td>
</tr>
</tbody>
</table>
