

## Transfusionists Talk – Transfusion Made Bloody Easy

### RH(D) IMMUNE GLOBULIN (Rhlg): TRANSFUSIONISTS QUESTIONS ANSWERED ...

March 18, 2025

#### Obstetric Indication Summary

<b>Obstetric Indication Summary [Rh(D) negative gestational parent]</b>	
<p><b>Sensitizing event:</b> Clinical condition/event associated with potential placental trauma or disruption of the fetomaternal interface.</p> <p><b>FMH:</b> fetomaternal hemorrhage</p> <p><b>Volume of fetal red blood cells considered potentially sensitizing</b> (leading to formation of anti-D antibody): 0.1 mL Rh(D) positive red blood cells.</p>	
<p><b>Rhlg dose:</b></p> <ul style="list-style-type: none"> <li>• 1,500 IU (300 mcg) protects against 30 mL fetal blood (15 mL fetal red blood cells).</li> <li>• 600 IU (120 mcg) protects against 12 mL fetal blood (6 mL fetal red blood cells).</li> </ul>	
<b>Gestational Age</b>	<b>Guidance</b>
<b>&lt; 8 weeks</b>	<ul style="list-style-type: none"> <li>• If potentially sensitizing events, i.e., threatened, spontaneous, or induced abortion, Rhlg is not required.</li> </ul>
<b>After 8 weeks</b>	<ul style="list-style-type: none"> <li>• Gestational Parent: blood group type and antibody screen. If serological Rh (D) test results: weak, inconclusive, or discrepant, then Rhesus Blood Group, D Antigen (RHD) genotyping required. <ul style="list-style-type: none"> <li>○ RHD genotype weak D type 1, 2, or 3: consider patient Rh(D) positive, Rhlg not required.</li> <li>○ RHD genotype any weak D type other than 1, 2, or 3 or partial D variant: consider patient Rh(D) negative, standard Rhlg prophylaxis required.</li> </ul> </li> <li>• Cell-free fetal DNA (cffDNA) gestational parent blood test (non-invasive testing of the fetus) determines if fetus is Rh (D) positive or negative; provides opportunity for targeted antenatal Rhlg treatment; currently is not the universal standard of care in Canada.</li> </ul>
<b>&lt; 20 weeks</b>	<p><i>Sensitizing event:</i> threatened, spontaneous, or induced abortion; molar pregnancy (partial or unknown), ectopic pregnancy.</p> <p>NOTE: 20 weeks gestation estimated fetoplacental blood volume: 30 mL.</p> <ul style="list-style-type: none"> <li>• The evidence regarding the fetal red blood cells entering maternal circulation is or is not sufficient to lead to sensitization is incongruent.</li> <li>• May consider not giving or giving Rhlg following risks/benefits discussion (600 or 1,500 IU; little evidence re: dose).</li> </ul>
<b>8-12 weeks</b>	
<b>≥ 12 weeks</b>	
<b>&gt; 20 weeks</b>	<p><i>Sensitizing event/FMH:</i> placental abruption, bleeding placenta previa, blunt abdominal trauma, unexplained uterine bleeding.</p> <ul style="list-style-type: none"> <li>• Quantification of FMH recommended (Kleihauer-Betke test, Flow cytometry; Rosette is a screening test). <ul style="list-style-type: none"> <li>○ Fetal bleed &lt; 12 mL, give Rhlg 600 IU</li> <li>○ Fetal bleed 12 – 30 mL, give Rhlg 1,500 IU</li> <li>○ Fetal bleed ≥ 30 mL, give Rhlg 1,500 IU &amp; additional Rhlg 50 IU/1 mL fetal bleed &gt; 30 mL.</li> </ul> </li> </ul>

<p><b>&gt; 20 weeks continued</b></p>	<p>NOTE: Ongoing antepartum hemorrhage (Rhlg was given for initial sensitizing event): serial quantitative FMH testing q 2-3 weeks, FMH positive, give additional Rhlg (50 IU/1 mL fetal bleed, round up to vial size).</p> <p><i>Sensitizing event/FMH:</i> Procedure: amniocentesis, chorionic villous sampling, cordocentesis, external cephalic version</p> <ul style="list-style-type: none"> <li>• Give Rhlg 1,500 IU.</li> </ul> <p>NOTE: Amniocentesis/chorionic villus sampling, per product monograph repeat Rhlg every 12 weeks during the pregnancy.</p>
<p><b>28 weeks</b></p>	<p><b><u>Routine antenatal prophylaxis.</u></b> Should be given, regardless of additional Rhlg previously given for potentially sensitizing events/FMH.</p> <ul style="list-style-type: none"> <li>• SOGC recommends single dose: 1,500 IU at 28 weeks gestation.</li> <li>• Alternate 2-dose regimen: 600 IU per dose at 28 &amp; 34 weeks gestation.</li> </ul> <p>NOTE: SOGC suggests 28 week antibody screening (to identify a gestational parent who may need other, more intensive monitoring and/or treatment due to the presence of other alloantibodies).</p> <p>Rhlg administration should not be deferred pending antibody screen results.</p>
<p><b>Delivery/ Postpartum</b></p>	<ul style="list-style-type: none"> <li>• To determine if Rhlg is needed, newborn blood typing using cord blood.</li> <li>• If newborn is Rh (D) negative, Rhlg is not required.</li> <li>• If newborn is Rh (D) positive, Rhlg prophylaxis is required.</li> </ul> <p>This Rhlg dose is <b><u>routine postpartum prophylaxis.</u></b> Should be given, regardless of additional Rhlg previously given for potentially sensitizing event/FMH.</p> <ul style="list-style-type: none"> <li>• A single dose of 600 IU or 1,500 IU can be given; <u>quantification of FMH is required</u> to determine if additional Rhlg is needed.</li> <li>• Timing of Rhlg: Ideally give Rhlg within 72 hours of delivery. Otherwise, give Rhlg 1,500 IU as soon as the need is recognized, for up to 28 days following delivery.</li> </ul>
